And yet, in many benchmarks (not that benchmarks should be taken as gospel) a stock Falcon030 is as fast as a TT030 with only ST-RAM! Personal experience using both machines seems to support this too.

>
>: So, in terms of shared RAM, the A1200 and the Falcon030 are about

>of the instructions.
>

Can you elaborate on why the 030's data cache can't be used? I remember in the early days of the ST when ICD and FastTech were coming out with 16Mhz 68000 accelerators. They mentioned that it was a little easier to design an accelerator for the ST compared to the Amiga because the Amiga's architecture was much more DMA driven. You didn't have to worry about the cache as much as you did on the Amiga.

The original ST had just one DMA channel used by both the floppy and hard disk. Then the Mega ST came out and added another DMA channel with the BLiTTER. Then the STe series came out and added another DMA channel with the stereo PCM system. And then the TT030 came out and added some more DMA channels with the Localtalk port and SCSI port. And of course, the Falcon030 adds some additional DMA channels too.

Anyway, TOS handles the 68030's cache by setting the dirty bit on whenever a DMA channel is used by the OS. For example, if you make an OS call that uses the BLiTTER, then TOS will just flush the cache. You don't even have to worry about all the DMA channels. The STe PCM stereo sound DMA channel is basically a read only operation so you don't have to worry about it writing over some data.

Anyway, I don't see why the data cache can't be used on the Falcon030. To be honest, I don't know whether it's used or not. The Control Panel doesn't make a distinction. It just allows you to turn some cache ON or OFF. I don't know if it's just the instruction cache or both of them.

>
>Again, there's the basic design difference between the two that will

>a lot.
>

What makes you think that an 040 based Falcon would still have a 16-bit data bus? There's a big difference between architecture and implemention. The ST/TT/Falcon computers are basically the same

architecture with radically different implementions.

There's nothing stopping Atari from producing a 040 based Falcon with a full 32-bit data path. Well, maybe limited resources....:-)

>color VGA mode while the Falcon030 does!

that's something completly different!! The Falcon has a new video system.
The TT has a 'expanded' ST video system (except TT-high).
If you take TT-high for example you may argument just the other way round.

>And yet, in many benchmarks (not that benchmarks should be taken as

I don't know what you are using... My experience says:
Falcon to TT(ST-RAM only) speed ratio is 0.6 to 0.7 (remember the clock
speed ratio is 0.5).

Bye Wolfgang

|>
|> Not heavy? Wait a minute.

No, it's not heavy up to 640x400 interlaced in Ham8 or 256 colors.
Now, on the 1280 it is a lot of bus contention.

|> The AGA chipset has a max. rez of about
|> 1440*240*8@60Hz =>19.8 megs/second
|> This means full bus contention, the Amiga guys here tell me, at least if
|> HAM-8 and 256colours have the same bus contention (seems so :-)).
|>

Read above now.

|> 320*200*8@60Hz =>3.7 megs/second => ~20 percent bus contention

320x200 modes have no bus contention. (Remember, 7 megs/sec for the CPU
and about 14 megs/sec for the custom chips-> 3.7 megs/sec is way below
the 7 megs/sec for the cpu).

|>
|> Okay, that WILL be enough for games.
|> But HAM-8 requires some more calculations because the colours influence each
|> other, that's why there won't be too many games using it. But this mode is
|> great for background graphics, at least. BTW, what are the specs for
|> sprites/bobs on the Amiga, are they independent from the background?

Bobs are graphics from the background moved with the blitter. NOw,
sprites are totally independent of the background so you bet they could do
it. It depends on the game you are doing, but they surely can use it for
a lot of games.

|>
|> BTW: F030 graphics in comparison:
|>
|> (Note: the built-in hard-/software does not give you that many modes where

|>
|> 1152*832*4@87Hz/2 =>19.9 megs/second
|> 1024*656*4@61.4Hz =>19.6 megs/second
|> 800*608*8@55.2Hz =>25.6 megs/second
|> 896*496*8@60Hz =>25.4 megs/second
|> 512*400*16@65.1Hz =>25.4 megs/second

Again, Falcon has no sprites, which for a lot of games will make it
dog-slow.

Flip,
I completely agree. But the code would have to be bigger than the
caches to get a true idea of the performance, correct? (not being a
smart-ass, I just don't know for sure) That way, we could see the
actual speed hit take place, since the program itself would be running
from 16 bit memory. I'll volunteer my 030 500 (although it's 25mhz,
I'm sure you could calculate the figures down to 16), as it has 1 meg
of 16 bit chip, and 2 megs of 16 bit fast attached (not counting the
4 megs of 32 bit). Any takers on this? Lamonte?

Sure you could. Instruction cache BURST would be possible provided a
proper RAM interface was supplied. This has nothing to do with whether or
not the RAM resource is shared. The data cache would still not be usable,
but that is another issue.

A problem would come with programs which "hit the metal" so to speak.
Its nice that the OS on the Falcon "takes care" of the cache issues by
flushing the cache when appropriate. However, if a program does not use
the OS, an instant problem erupts with the data cache and stale data from
DMA accesses.
Now, even disregarding this, there is a big drawback to the OS handling
the cache as you say. System overhead would be far too great to flush single
entries in the cache for every DMA operation. Now, if the cache is simply
flushed entirely with every single DMA write to memory, you quickly lose the
advantage of the data cache as it will not hold valid data for long
periods of time.

You're absolutely right. The catch here I guess will be to make sure
that we find out in advance the maximum cache size we're dealing with,
and whether it is an instruction or data or both cache.

If it is just instruction, it should be "fixed" by making the benchmarking
code loop through a segment of code larger than what would fit in the cache.
We could literally put a few thousand "moves" inside a dbra loop and watch
it run.

I think it should be pretty simple.. we just do something like this (syntax
is for DevPac ST... i believe there is also an Amiga version?):

```
move.w #9,d0
.loop
REPT 1000
move.l (a0)+,(a1)+
ENDR
dbra d0,.loop
```

I think this should easily blow most small instruction caches... a 4k block
in a data cache could possibly catch this, but i'm not an expert on the
various caching methods used on the accelerators.

I think the worst stumbling block will be to determine whether or not the
resolution of the system clocks for timing the benchmark is accurate. I
guess on the ST, the best choice is to count 200hz "ticks" from the timer.

I'm not too sure I agree with this. I never liked the idea of
benchmarks designed to negate the cache because real life applications
don't have this property.

The performance gains offered by caches are real. With the cache ON
in the 16Mhz 68000 based Mega STe, I really do see twice the
performance (i.e. unarcing files are about twice as fast etc.)

But with the cache OFF, the Mega STe offers about the same performance
as a regular 1040 STe.

And using a benchmark designed to negate the cache would say that the
Mega STe is basically only as fast as a 1040 STe.

However, try telling that to the owners of Mega STe's! They'll tell
you differently.

I totally agree that caches are a big factor in performance of a system
(I'm running a 16mhz 68000 in a Mega ST with a 16k cache and it does wonders
over something like the old JRI JATO boards that had no cache...).

However, I guess what we're getting at is that the main gripe we're trying
to benchmark is the "hit" the Falcon takes vs. an A500 or comparable system
with an 030 when going to 16-bit RAM. Some believe it will be the same. I
think there probably will be some similiarties... but 3rd party boards
tend to have additional caching (not just the 030's cache) to enhance
performance so that the access to 16-bit (and SLOW) RAM will not be so bad.
On the Falcon, the RAM is faster, but it still has to do the 16-bit access.
Bus speed (Falcon's 030 accesses 16-bit RAM at 16mhz... A500 i don't know...
A1200 reputedly does chipRAM 32-bits at a time, but at 7.16Mhz) should
be a factor.

I think you mean a 50% slowdown. A 100% slowdown would mean 100% of the
speed which would mean the machine is not running. When counting _up_ you
double the figure to mean twice as fast like "20 is 100% as much as 10", but
when counting _down_ you take half like "10 is 50% as much as 20". Anyway,
the slowdown can be more than the 50% (or 100% as you stated). If the CPU
asks to fetch 1 byte then 2 passes are still taken to get that 1 byte. The
first 16 bits are retrieved, then the second 16 bits are retrieved. But the

CPU only needed that first 8 bits of all that, so it took an extra pass
to get something it will throw out. Same thing if the CPU asks for 16 bits.
It will take a second pass to get 16 bits that it won't even use. If on
a 32 bit data path, no matter if the CPU asks for 8, 16, or 32 bits it will
only take 1 pass to get the data.
If using a 68000 with 16 bit data path to RAM and you asked for 8 bits
it would only take 1 pass to grab it. However, the 68030 to 16 bit wide RAM
will take 2 passes to get that same 8 bits. The 68030 will actually be slower
than the 68000 in these type of cases. In fact a 68030 is slower than a 68000
at the _same_ clockspeed when both are using a 16 bit data path.

That's okay, in order to find a falcon you'd have to make that a two-thousand mile radius. Oh, you meant the *computer*? Well then, better tack on a few more zeros to that figure. :)

In article <21s1voINNo4n@mojo.eng.umd.edu>, Gerry Mon (gerrymon@eng.umd.edu) wrote:
: The interface to the ST-RAM on the Falcon030 is designed for, at
: _worst_, a 16Mhz 68000. In other words, the bus speed on the Falcon030
: is "twice as fast" as the one in the A500 so I wouldn't expect it to
: suffer a 400% to 500% performance degradation like the A500.

This is a lot tougher to assure. You can't say that they designed it for
that because bus timings haven't been available, as far as I know. If
you've got some, do pass them around.

: In fact, I still believe it's at most a 100% degradation. If Atari
: could magically increase the Falcon030's data bus to 32-bits instead
: of 16-bits, I would only expect a performance boost of, at most, 100%.
: This seems so logical to me!

And that's right.

: Are you saying that if Atari magically increases the Falcon030's data
: bus to 32-bits we would see a 400% to 500% increase in speed? How
: would that occur? You still couldn't take advantage of burst mode
: since ST-RAM is shared.

Correct. You CAN'T. That 4-500% difference is between ST and TT ram,
not between the two sets of chip. I did think that was obvious... The
020 1200 and the 030 Falcon are going to be very, very close in
performance.

Closer than it should be, considering its an 030.

: And yet, the TT030 doesn't have the bandwidth to support a 640x480 256
: color VGA mode while the Falcon030 does!

As a sidenote, it's possible they simply didn't design into it the
ability to variably steal cycles from the CPU.

: Can you elaborate on why the 030's data cache can't be used? I
: remember in the early days of the ST when ICD and FastTech were
: coming out with 16Mhz 68000 accelerators. They mentioned that it was
: a little easier to design an accelerator for the ST compared to the
: Amiga because the Amiga's architecture was much more DMA driven. You
: didn't have to worry about the cache as much as you did on the Amiga.

You will ALWAYS have to worry about cache. If you've got the OS
capabilities, you ask the OS to clear the data cache before and after
your DMA operation (it may just be after), but that only works in ram
that you own; since it isn't possible for the Falcon to DMA into "fast

ram" space, that isn't an issue.

In chip ram, the data cand change right out from under the CPU. You can't surround your DMA, because it's not always possible, things are happening at the hardware level. As a result, if you want to use the data cache, you've got to do a LOT of hardware-level bus snooping.

: Panel doesn't make a distinction. It just allows you to turn some
: cache ON or OFF. I don't know if it's just the instruction cache or
: both of them.

It is very likely just the instruction cache. If you really want to know, there are ways to find out, hack your way into it.

: What makes you think that an 040 based Falcon would still have a
: 16-bit data bus? There's a big difference between architecture and

Eh? Who's talking about an 040-based Falcon? I'm talking about an accelerator. I'm not convinced it'll be anytime soon before you see another system from Atari.

: There's nothing stopping Atari from producing a 040 based Falcon with
: a full 32-bit data path. Well, maybe limited resources....:-)

Correct, there isn't. And for the sake of the 040 in that machine, I hope they do. And this time, I hope they get it right.

Someone at Atari made the decision not to release their official Atari Falcon030 Dealership list.

If you are an Atari developer, how do you feel about this?

If you are a developer for another platform, how would you feel if you were not allowed to know where your products were being sold.

Why don't you think Atari is releasing this list?

Thanks.

Len

Go ahead, expand. Just keep track of those checks so I can tell you in the end that I paid less for the same thing. The one thing about having all these expansion cards is that you'll run into incompatibility, just like the PC world, because developers cannot depend on any specific machine having those expansions. If I wrote a network package for the LAN port on a F030, I know all F030's have them, and I don't have to worry about what LAN "card" they have in their machines.

Don't get me wrong, I like Amiga's and Atari's; I sell Amiga's and use Atari's. But, I just _really_ hate people who don't have their facts straight. If you're going to argue, at least attempt to get your facts right. It just kills your argument.

I beg to differ. My _25 mhz_ CPU-MMU on my 500 takes an _incredible_ drop when I run out of 32 bit RAM. According to SysInfo tests, an unexpanded 1200 will outrun my 25 mhz 030 with MMU based 500.. easily..

Ok, I'm not a dealer, so I can't comment on this directly. However, from what I've read, it CAN be done. Maybe it is that only larger dealers have the resources to do this. There's none anywhere near me, so I can't say for sure.

I _do_ do raytracing, 3D rendering, and color mapping already. I don't do video or multimedia, not on my Amiga anyway (I use SGI's at my job at school) so I don't worry with real-time transitions. But, doesn't the Toaster, Opalvision, Scala, ImageFX, etc. do this? Where's the DSP in those products?

> Go ahead, expand. Just keep track of those checks so I can tell you in the

This is a true point. It is nice to write software that counts on the base machine having specific hardware. But, I refuse to believe that every single user of a home personal computer will use every single piece of hardware, especially when it's advanced hardware like a DSP, SCSI II, midi, etc. They're nice to have, but not everyone needs it. I would be outraged, if I bought my Amiga, and paid extra for a midi port that I'd never use, or a SCSI II interface, when I couldn't afford a real SCSI II drive to take advantage of it. A well-designed piece of hardware could be easily supported if the designers include a thorough guide to programming for it. And, successful hardware would sell enough to be considered a near standard. How many programs now directly support a DCTV?

>

I state opinions and facts as they pertain to me. I _know_ the effect of having 16 bit memory attached to a 32 bit processor. I _know_ that I can raytrace and render with my current, DSP-less setup. (Although, granted, the extra speed would help a lot :). And above all, I know what I need and can afford. Right now, midi does not exist for me, and SCSI II is well beyond my needs. You have no right to expect me to willingly pay for something I have no use for. With the Amiga line, I at least have options available, that takes my budget into account. The same can definitely not be said of the Falcon.

Well, just remember, the Amiga takes a severe performance hit when it leaves
that FastRAM and goes to that 16-bit RAM on an expanded A2000.

:)

I know this because I've been hearing about how bad (tm) it is.

:)

I'd rather be able to use that slower RAM when I need to, than not have
it available at all. It's kind of the same as saying that if I had a 40ms
drive, and bought a new 20ms I'd rather still be allowed to use the slower
one when I have need for it. Ie. the performance may be worse, but if
it's a bonus, I'd rather have it than not. P.S. I have a real 32 bit system,
so this discussion does not apply to me anyway.
>:)
>I know this because I've been hearing about how bad (tm) it is.
In the case I've outlined, you have as much 32 bit as you want, the 16 bit
is just an extra. It's only really bad if you can't actually have any
32 bit memory.

True, but when is C= going to come out with a machine that has enhanced
sound BUILT IN? Please note that 16bit sound cards are *already* available
for Amiga models that have slots but very few applications support them.
Have you ever heard of any games for the Amiga that have 16bit audio
and/or use more than four voices?

BTW, I own an A1200 and I'm very disappointed in Commodore for not upgrading
the sound in the A1200 and A4000. IMO, they really should have done this.

As a matter of fact, Amigo Business Computers has just recently come out
with a network card that plugs into the A1200's PCMCIA slot. The board
goes for about $400 and the software that you need to use it goes for
around $200 if my memory serves me correctly. I called Amigo up last
week and asked them does this setup grok TCP/IP. They told me that
basically all their package could do is hook up multiple 1200 systems
to another Amiga that has an A2065 ethernet board in it. That's too
bad; I was hoping to add my 1200 to my Un*x network. <sigh>
But, that's not to say I'll never be able to do this. I'm sure there
are some Amiga software developers out there who are working on just

such a thing; it's only a matter of time before something like this
becomes available.

## 1092. Jaguar: Falcon the Next Generation

Newsgroup: comp.sys.atari.advocacy

I think that the Jaguar will be a nice addition to the Atari family of electronics.. I hope that they decide to really back this one.

I bought a Lynx. I really like it, But I wish they would stop wasting time on their ST/Falcon computers. They should have marketed the lynx better and market the Jaguar. They should forget the falcon. Very few users use them. The only ones who buy them are previous Atari users. Where as many people might buy the jaguar.. Atari should learn this and learn it quick

As long as they can make any money off their computers they will
kepp making more;maybe not as fast as some people would like but they will
certainly be getting new computers developed. At least I hope so. I love
both my Falcon and ST! BTW the falcon is indeed a very attractive machine;
TOS 4.04 is IMHO better than SYS 7 on a mac.

>TOS 4.04 is IMHO better than SYS 7 on a mac.

Hey, System 7 just plain SUCKS. The only reason it hasn't been hailed
as the second coming of the Ford Pinto (both are unrecoverable
after ANY crash) is that there are so many Windoze users.

By the way, in the interest of heading off any flames, I program in
System 7 for $$ (prostitution, but hey its $$) so I know EXACTLY
what a load of donkey poo it is.

## 1096. Falcons and Amigas

Newsgroup: comp.sys.atari.advocacy
Date: 1993-07-19 22:25:40 UTC
From: cmedley@wam.umd.edu
Message-ID: <22f714$3uf@cville-srv.wam.umd.edu>
Source record: 22231
Cross-posted to: comp.sys.atari.advocacy,comp.sys.amiga.advocacy

I've called around and it seems that local to me, a few music stores
are carrying the Falcon as well as the closest dealer (Toad Computers). All
have the same price:

Falcon 030 4/80 $1299
Falcon 030 4/0 $999

I've been also looking into the Amiga 1200/4000 for some video work and found
that the discussions we've been having in *.advocacy aren't completely
truthful. For example, I've found that the system prices are pretty decent
on 1200 models, but the 4000 isn't as inexpensive, i.e.:

A1200 2/0 $429 (best price... others mostly at $499)
A4000/30 $1799 (25mhz 030, 4MB of RAM (2MB chip, 2MB Fast), 120MB HD)

Also, counting music dealers.. this is amusing, but there may actually be
more dealers selling Falcons local to me than Amigas. Frightening stuff, eh?

Also, I found some mention of the Amiga Sunrize boards and some of the 3rd
party accelerators for the 1200. As of yet, the only major 3rd party h/w
expansion for the Falcon I can confirm is shipping now is a 3rd party board
for a memory upgrade that is $99 unpopulated, but which will accept standard
SIMMS.

According to Buried Treasure in Rockville, they don't believe CSA products
are "reliable" and advocate an accelerator for the A1200 from GVP that is
called the Turbo+ which has 4MB of FastRAM, 40mhz 68EC030/882 and costs $579.

Also, contrary to what some Amiga advocates were saying, the Sunrize digital
audio boards cost entirely too much ($579) for what they do, relative to the
pricing of a Falcon.

Now for some questions....

1) Does anyone know of any way other than through the Sunrize to get the A1200
to generate and/or recognize SMPTE? Ideally, I'd like to synchronize video
and audio, and be able to use either one as a SMPTE generator.

2) Is there a genlock shipping for the Falcon? And is there any animation
software for the Falcon that can spit out SMPTE?

<all i know about SMPTE is that it is required for synch... anyone with more
knowledge, please email... basically i want to be able to synchronize music
to video and video to music... and go either way>

3) Are there any sequencers available for the Falcon that do effects processing
via the DSP? Hard disk recording is not going to be a major use until i get

a larger capacity drive, so i'm more interested in effects processing.

4) What's the best C compiler on the Amiga?

5) What type of performance increase does the GVP or CSA accelerator give over a stock 1200 w/ FastRAM. i.e., does the 40/50mhz 68030 really burn? Is it giving a 3-fold increase in speed as expected? How large a cache is used on it?

6) Will Atari ship any of the HD installed s/w with the Falcon 030 4/0?

This is the third time you are trying to use this argument. This is getting
very boring. Your 16bit RAM on your Amiga has a 7.1 MHz bus. All right?

I have invested some time to get some facts about the RAM access of the
Falcon. Result: the rumor, claiming that the Falcon has only 16 bit access
to the RAM is wrong.
Hint 1: Read the Atari Service Guide pages 12-14 about the System RAM
connection. The data bus is 32 bit wide.
Hint 2: Count the RAM chips on the Falcon RAM cards (1,2,3...31,32!).
Hint 3: Compare the speed of an Atari TT with FastRAM to the speed of the
Falcon. The TT is exactly as duoble as fast as the Falcon (as you
expect when one system has 32 MHz and the other only 16 MHz).

I have asked the amiga guys about their source of information concerning
the RAM access. I have received a few answers, one half wrong the other one
non-verified rumors. Things don't become true if you repeat talking about it!

>I state opinions and facts as they pertain to me. I _know_ the effect of
>having 16 bit memory attached to a 32 bit processor. I _know_ that I can

Oups, here it is again!

Since this is the only flaw you encountered in the Falcons design, you
now have to admit that the Falcons design is perfect :).

Ciao, Heiko.

Unfortunately, from what I understand, the Falcon030's 68030 does only have 16-bit access to system RAM. Bill Rehbock confirmed this on Genie.

However, the system RAM itself is 32-bits wide. The video system has 32-bit access to it so that it can have enough bandwidth for the new graphics modes. But the 68030 only has 16-bit access to it.

It's sort similiar to how the TT030 works. The TT030's system RAM (ST-RAM) is 64-bits wide but the 68030 only has 32-bit access to it.

Jack Tramiel said (eons ago) that purchasers of the ST series of
computers "would not be abandoned," and Atari is holding true to
that promise.

Correct. The data bus of the memory system IS 32bit. The CPU however
doesn't access the RAM 32bit at a time. Just the video logic does
32bit fetches.

>Hint 2: Count the RAM chips on the Falcon RAM cards (1,2,3...31,32!).

See above.

>Hint 3: Compare the speed of an Atari TT with FastRAM to the speed of the

This of course depends on the test program. If you see just twice the
speed then the test program runs completely within the cache and just
performs 8 or 16bit accesses to memory.

>non-verified rumors. Things don't become true if you repeat talking about it!

This is exactly what you do. Our information comes from an Atari engineer
that posted into one of the Atari newsgroups.

I didn't know this could hold for so long: IT'S NOT WRONG.
Someone, a WHILE AGO posted SEVERAL TIMES some specs ATARI THEMSELVES released. The Falcon has 16-bit CPU access.

If I can get hold of that, I'll do. Give ATARI a call for that matter.
Seems like the Custom chips of the Falcon has 32-bit access, but no so for the CPU.

|> Hint 1: Read the Atari Service Guide pages 12-14 about the System RAM

: Hint 2: Count the RAM chips on the Falcon RAM cards (1,2,3...31,32!).

Okay, now here we have some misconceptions. Yes, the ram is physically
32 bits wide. Yes, the custom chips access that ram at the full, 32-bit
width.

NO, the CPU does not access that ram in 32-bit segments. It is accessed
by the CPU as a 16-bit device, because that is how they allocated it; for
all intents and purposes, the chipset is designed to allow "slots" for a
16MHz 68000's memory access times, in the same way that the Amiga's
chipset leaves 560ns gaps for the CPU to make use of. On the Falcon,
those slots are different than the Amiga's, yielding more time; however,
that CPU only accesses that ram at 16 bits of width.

The knowledge of the "slots" on the falcon is based on preliminary
knowledge, I haven't got solid numbers yet. It sure would be nice to
have some from Atari, though.

As is, you've got to take a great deal of care to make sure that your
tests test the proper things, and to take what you read EXTREMELY
literally.

: Since this is the only flaw you encountered in the Falcons design, you
: now have to admit that the Falcons design is perfect :).

This is NOT the only flaw I have encountered. I find flaw with the
entire memory architecture and layout, which will impede a whole lot more
than your CPU when you try to do things that don't fit perfectly into the
motherboard's idea of reality.

Ciao, Wubba

There could be another reason for this phenomenon: As I recall the TT was
kind of "68030DX2"; originally it had been designed as a 16Mhz machine.
When C='s A3000 entered the market -the TT wasn't out then- Atari
decided to speed up the CPU (and nothing else) to 32Mhz. So the memory
subsystem and everything else in the TT runs at 16Mhz. If the TT's 030
does 32bit wide memory accesses they have to be about twice as fast as
those of the Falcon.

In a previous article, gblock@csd4.csd.uwm.edu (Gregory R Block) says:

>This is NOT the only flaw I have encountered. I find flaw with the
>entire memory architecture and layout, which will impede a whole lot more
>than your CPU when you try to do things that don't fit perfectly into the
>motherboard's idea of reality.

Can you please explain just what the hell you're talking about?!?
???things that don't fit into the motherboards idea of reality???

I hope you actually have a Falcon and are running some tests in order to
at least attempt to support what are otherwise extremely vague and
unfounded rumours. If you have something concrete (ie numbers from a test
program) then post the results or better yet send me a copy of your
'benchmarks'. Otherwise please refrain from posting what I have to
consider absolute nonsense. I Have a Falcon and have not noticed the
OBVIOUS (to you at least) critically detrimental symptoms of this
'crippled architecture'. Please enlighten us as to these 'flaws'; if there
really are any I would be interested to find out but please, no more of
these vague ramblings.

Jack

>a 16 bit bus for $200, then how the f**k could they make one with a
>64 bit processor (does this run under a 16 bit bus as well? :) )
>for that price?

The system indeed runs a custom-designed RISC chip designed by Atari & Motorola
that is 64 bits, and the system has a full 64-bit bus.... It also has a
32-bit expansion slot for future connections.

I think it is a nice machine on paper, but I also know that if they don't
get the massive 3rd party and retail support that 3DO is expecting to get,
the Jaguar may look pretty lame when it arrives in stores.

Also consider that as the chips are custom and designed specifically for a
games system, they probably are not good general purpose computer chips,
otherwise the technology may have found its way into the Falcon.

P.S., the official date for the 3DO rollout is Oct. 1st. The Jaguar is
(according to Babbage's) hitting their stores Oct 31st (Hallowe'en, perhaps
a trick or treat? :) ).

# 1107. Falcon BenchMarks

Newsgroup: comp.sys.atari.advocacy
Date: 1993-07-21 17:02:55 UTC
From: renfro@bnr.ca
Message-ID: <22jsrv$4mh@crchh327.bnr.ca>
Source record: 22144

Stopped by my local dealer last week and though I wasn't expecting him to have any yet, there was the Falcon on display. Spent an hour or so being impressed by several audio and visual demos and decided I had to have one. Brought it home that night and have been very pleased with its overall performance and capabilities. Multi-TOS does need some work in the speed area and also the VDI routines in 256+ color modes are not as fast as they could be, but I certainly do not see any crippling effects as many have suggested.

In comparison, I had a MegaST with 16Mhz accelerator and I am finding the Falcon to be significantly faster in many areas. I am working on recording some timings from GEM-View (a picture displayer prg) for loading in and displaying JPG files. I am using GEM-View because it very nicely displays the processing time after the picture is loaded.

So I will post the results in a day or two, but was just wondering what the naysayers think the relative numbers would look like. I will post numbers for both 8Mhz and 16Mhz modes on the Mega and both TOS and M-TOS on the Falcon. To be fair, I will run both machines in ST-High mode, but will also show results for 256 color mode (640x480) on the Falcon.

Assuming the crippled architecture that has been suggested, what do you think the relative numbers will look like? Will the Falcon take the same time to load a JPG as a MegaST at 16Mhz (and remember, this is an add on accelerator with cache, so the rest of the machine is still at 8MHz). Will the Falcon be twice as fast? What say you?

BTW, if anyone has any better benchmark suggestions, I will be glad to try them out.

Not a flame, merely a nitpick: I remember waiting with bated breath for
the arrival of CDI, fearing its thunderous march through the consumer
universe, etc etc etc.

>ad recently for a 1200 expansion case coming soon..

At what cost? I'd believe it'll be much cheaper to get rid of your stupid
A1200 and buy a 4000/040 instead :-). Or an A3000, or a 4000/030, or...

>> Is available in Germany, price: 700$, up to 128 megs of FastRAM possible,
>> 32 MHz 68030, VME bus e.g. for graphics cards.

>argument. And, whether or not you believe me, that 32 mhz '030 will see
>and even bigger bottleneck, when it accesses 16 bit ram.

First: yes, the bottleneck will be as terrible as the A1200's bottleneck when
accessing ChipRAM, with the only difference that the F030 may have up to 14
megs of ST RAM. Are the great expansion cpabilities of the board a flaw in
your opinion? Remember that there are professional Calamus users who might
make use of this amount of memory. There is no Calamus for SGI yet, and the
Win/NT version is not shipping currently, AFAIK.

>> Not for stock Falcons, but for VME bus. And a VME adaptor costs 300$ in
>> Germany. Plus, the Falcon is capable to display resolutions up to 880*608
>> noninterlaced w/ 256 colours, 512*400 w/ 65536 colours, 1152*896 87Hz
>> interlaced w/ 16 colours with external clocking HW and some SW
>> (e.g. Screenblaster ~90$, BlowUp030 ~80$).
>
>$300? So, are you actually admitting you have to expand a Falcon to get

>older ECS Amigas have built-in slots that will hold a Retina board, which
>only costs $499, that could hold 4 of your 512x400 screens.. but in 24
>bit color...

A graphics board for 500$ with four megs of VRAM? Oh no, you are talking of
a 1 meg VRAM/3 meg DRAM board or similar, holding does not mean displaying
at the same time. There is no Amiga graphics board for 500$ that will display
1024*800 in 24bit. A VME bus (as shipping with the speeder and selling for
300$) may take any of the TT/MegaSTE graphics boards, up to the Matrix TC1212,
with 4 megs VRAM/ 4 megs DRAM, very similar to the EGS110. Not to mention

those nice 19" racks with lots of VME slots for industrial use.

The rez. mentioned above will cost you about 90$ for a ScreenBlaster HW/SW package, nothing else. And the BlowUp030 package includes 880*608ni and 1280*1024i rez. (What should be enough if you have a 14" monitor). Not to mention that it provides virtual rez. w/ 5000*5000 pixels and more (RAM limit?) for a price of ~80$.
The AGA chipset is incapable of displaying 800*600ni, 1280*1024i.
It is capable of displaying 1024*768i, I think, at 50/60Hz (Falcon:>85Hz).

If you want a graphics board for the Falcon, you will have to pay a higher price for low-end boards (cheapest ~500$ for a 1meg VRAM VME board with Inmos G300 chip, 24bit depth), admitted. But these cheap boards won't give you that much, and when thinking of 2/4meg VRAM boards, one should not look at the price of the adaptor too much, because monitor and board will be somewhat more expensive :-).

## 1111. Falcon's 256+ color mode ...

Newsgroup: comp.sys.atari.advocacy
Date: 1993-07-22 12:21:16 UTC
From: bpat@binkley.cs.mcgill.ca
Message-ID: <22m0ns$l9g@binkley.cs.mcgill.ca>
Source record: 22147

I hear everyone talking about how slow the Falcon is in modes with
many colors, and this really eludes me. (I don't have one, so I can't
test things out). I certainly hope that from 256 colors and above,
there are no more bit-planes, but just 1 (or more) bytes per pixel
(I'd hate to see true color modes in planes :)
If I'm right, then where does the slow-down come from ? Certainly
programs should be able to change and entire byte faster than they
could do the bit twiddling for planes. Is it a fault in the VDI's
programming, or is it mostly caused by the video stealing more
bandwidth out of the RAM ? (In which case, using some TT-type RAM
would give a tremendous improvement)

Patrick.

The slowdown I think comes from the VDI. But really even in the
256 collor mode the desktop is fast; certainly at least as fast as a MAC LCII.

You can not really compare the two time periods, though if Nintendo did release any version of a home computer, that plays all SNES games, it would sell extremely well. When Atari was making the 2600, home computers cost about the same as they do right now, $700->$2000, and you did not get much computer by todays standard. A person justifies a computer for their kid buy looking at what it will help them do/learn, then what it will help their kid do/learn. Since we are not really a nation of engineers early home computers where not seen as having as great a value as they do today.

I seem to remember also hearing that the VDI was a fault and perhaps is not written properly to handle this mode. There is only minimal slowdown on the desktop and non VDI related things are as fast as any other mode. The biggest slowdown I have seen is when using VDI to do text. When showing a text file from the desktop, it is really slow in outputting the lines to the screen.

## 1117. Ten falcon questions (sound, disk, ethernet)

Newsgroup: comp.sys.atari.advocacy
Date: 1993-07-25 06:31:32 UTC
From: hitt@Xenon.Stanford.EDU
Message-ID: <1993Jul25.063132.13605@CSD-NewsHost.Stanford.EDU>
Source record: 22153

Some questions for those with experience using Falcons:

(1) Can long 16-bit, stereophonic, 44.1 kHz sound files (long means
larger than RAM, say 30 or more megabytes) be played without
pops or clicks? (I'd be willing to not try to have the processor
run other jobs while the sound is playing.)

(2) Can sounds be played (without pops or clicks) from any disk? I.e.,
if one attaches an external (SCSI) disk which is reasonably fast
(13 or 15 ms), can (long) sounds be played from it as well as from
the internal disk?

(3) Is there a digital output for the sound?

(4) For getting a ``clean'' output (i.e., without electrical noise from
disk drives, etc) is it necessary to get extra hardware?

About disks:

(5) What kind of formatting needs to be done on external disks (e.g.,
if one buys a pre-formatted disk, should it be Mac style or DOS style,
or is either acceptable?)?

(6) What kind of file systems can be mounted? Are there mountable
file systems based on anything like (UNIX) inodes? If so,
is the access fast enough for playback of long sound files, and
if not, do the disks need to be periodically compacted (or something
similar)?

I've seen it posted here that the Falcon has built-in LAN.

(7) Does anybody have experience using the Falcon's ethernet in a
heterogeneous environment?
Is it speedy enough (say 500 kB/sec)?
Are ftp and telnet included with the bundled software?

Finally, about coding:

(8) Has the GNU stuff (compiler, debugger, emacs) been ported to the
Falcon?
Do people have any memorable experiences on the Falcon with these?

(9) Does the Falcon include an FPU (and if not, is there an easy provision
for installing one?)?
Does anyone have experience with doing things like big double
precision computations on the Falcon (and has there been any
problem with bus width---i'm a little
unsure about exactly what the deal is here)?

(10) How feasible is it to run a Falcon from over the ethernet (e.g., ftp a batch of data to it, telnet to it to launch some job, ftp back the results, or of course do all this programmatically)?

Thank you for any posts or e-mail of your experiences.

dan

## 1118. Re: The Jaguar...

Newsgroup: comp.sys.atari.advocacy

Source record: 22154
Cross-posted to: comp.sys.amiga.advocacy,comp.sys.amiga.games,comp.sys.atari.advocacy

From cmedley@wam.umd.edu ('Flip' Medley), referring to the Jaguar:

>The system indeed runs a custom-designed RISC chip designed by Atari & Motorola
>that is 64 bits, and the system has a full 64-bit bus.... It also has a
>32-bit expansion slot for future connections.

What chips are involved in the 3DO machine? (I suppose there is no
FAQ on this yet . . .) How wide are its buses?

Does anyone have actual experience either using or designing games
for both the 3DO and Jaguar and have an opinion to express?

dan

>than that because of the poor support Atari provides...
>

Well sure, Apple can sell LCIII machines for $1300, but how much money do you think they're making on them? Apple has dropped prices tremendously in the last year to try and keep up with the clone wars, but it seems to me even Apple has a hard time of selling computers where they only make $10 per computer sold. I think the Falcon is reasonably priced for what it can do. This doesn't mean it's the cheapest by any rate, but at least the dealers aren't forced out of business because they have to sell hundreds of machines to make a decent profit. For that matter, Atari's own finances probably would probably go straight down the toilet if they sold machines for MS-DOS clone prices and made less than $100 on each machine.

Power without the price only applied before the advent of vicious price wars (can you say clone companies falling by the wayside, anyone?) and the giant warehouse computer stores which sell computers by the gross and don't know diddly about what they're selling.

No flames intended, I just don't think Atari could survive if they tried to undercut anyone else's prices, they can't afford to and in the current market position it probably wouldn't help them to lower prices anyway.

> run other jobs while the sound is playing.)

Yes. If you have a HD of course... :)

>(2) Can sounds be played (without pops or clicks) from any disk? I.e.,
> if one attaches an external (SCSI) disk which is reasonably fast
> (13 or 15 ms), can (long) sounds be played from it as well as from
> the internal disk?

Yes.

>(3) Is there a digital output for the sound?

No. It's just a mini headphone jack. I think Atari should have improved
this...

>(4) For getting a ``clean'' output (i.e., without electrical noise from
> disk drives, etc) is it necessary to get extra hardware?

Not in my experience... I've had no trouble when connecting it to my CD
player and recording 50KHz for several seconds. :) It played back fine;
no discernable difference from the CD.

>About disks:

>(5) What kind of formatting needs to be done on external disks (e.g.,
> if one buys a pre-formatted disk, should it be Mac style or DOS style,
> or is either acceptable?)?

You mean 1.44 meg floppies? The floppies are DOS compatable. You can buy
Mac preformatted disks and then reformat them if you want... but DOS
preformatted disks work fine without reformatting.

>(6) What kind of file systems can be mounted? Are there mountable
> file systems based on anything like (UNIX) inodes? If so,
> is the access fast enough for playback of long sound files, and
> if not, do the disks need to be periodically compacted (or something
> similar)?

With MiNT, there are many possibilities. The Minix filesystem, (much like
Unix) is one of the most popular. It is faster than the built-in TOS
filesystem. You must have your boot partition be the standard TOS

filesystem, but if you run MiNT all the time, most other programs will run fine from a Minix filesystem. I'm not sure what other filesystems are available currently, but I believe there's one for Kodak PhotoCD and I've heard talk about a Macintosh filesystem...

>I've seen it posted here that the Falcon has built-in LAN.

Yes, it does have a LAN port. Not many things use it yet though...

>(7) Does anybody have experience using the Falcon's ethernet in a
> heterogeneous environment?
> Is it speedy enough (say 500 kB/sec)?
> Are ftp and telnet included with the bundled software?

FTP and Telnet are not included; I don't believe they've been ported to MiNT yet. When they are, you'll probably be able to FTP them from atari.archive.umich.edu. I doubt the LAN port will do 500k/sec (the LAN is not ethernet), but I think there may be some European companies that have a SCSI ethernet for the Falcon that should do well over that... I have not had experience with it though.

>Finally, about coding:

>(8) Has the GNU stuff (compiler, debugger, emacs) been ported to the
> Falcon?

Yes, and Simon Gornall has developed a nice little installation system called the "MiNT distribution kit" found on atari.archive. I haven't been able to get it to work on the Falcon though, but Simon (last I heard) is in the process of rewriting it. In any case, all the GNU stuff is on atari.archive.umich.edu.

> Do people have any memorable experiences on the Falcon with these?

Hmm, they work, if that's what you mean...

>(9) Does the Falcon include an FPU (and if not, is there an easy provision
> for installing one?)?

No FPU, but there is a slot for one.

> Does anyone have experience with doing things like big double
> precision computations on the Falcon (and has there been any
> problem with bus width---i'm a little
> unsure about exactly what the deal is here)?

The Falcon has a 32bit bus, but the memory is 16bit (from what I gather anyway). There are third party products you can buy that will allow you to hook up 32bit ram, at the expense of some compatability (mostly older games and such). I haven't any experience with big calculations with it though...

>(10) How feasible is it to run a Falcon from over the ethernet (e.g.,
> ftp a batch of data to it, telnet to it to launch some job, ftp
> back the results, or of course do all this programmatically)?

Couldn't help you there, but I'd imaging if it's connected to an Ethernet, you could do what you describe if MiNT is installed (which it would probably have to be to be connected to an Ethernet...) The Ethernet package should include all the right utilities.

>Brian
Do home users really think computers have great value today? I thought most people were smarter than that. The early 80s was when computers were pushed for home use - remember all the recipe books, cheque book balancing and other things they were supposed to be used for? New computers are no better at that stuff, the only thing that has changed is that morepeople have ms-dos peecees at work, and can steal very expensive software thus making a home computer a 'bargain'. A nintendo computer that was not msdos compatible would have all the same problems that Atari, Amiga, and apple are facing. You may be right that Atari would have done better had there been some backwards compatibility between their systems in the early 80s.

Just to let you know, there is an ST port of KA9Q, available at
umich. Altho the date is pre-Falcon, meaning there would be no
LAN code included, I imagine that it would be almost trivial
to include the code for the LAN port as well as the SLIP, etc,
thats already in there.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

This can be changed so that at bootup it displays a nicer resolution.
This program will also let me chnge the desktop and/or keyboard layout to
many different languages:german, french, itallian etc...
re the memory comment: all multitasking systems I've seen suck up memory
like crazy....

re the GUI comment: IMHO it is much nicer to work with than the newest MAC os,
system 7.

There is no electrical noise from disk drives etc. The output is analog
but someone could easily design a digital interface to CD/DAT players
through the DSP port.

>
>About disks:
>
>(5) What kind of formatting needs to be done on external disks (e.g.,
> if one buys a pre-formatted disk, should it be Mac style or DOS style,

DOS works fine but the HD disks are only formatted to 18 sectors 80 tracks;
I reformat all of mine to 20 sec/ 82 tracks which gives me 1.66MB instead
of 1.44 MB

re FPU : the Falcon has a built in FPU socket so you can plug it in and go.

Jack

Then you haven't seen an Amiga. The A1000 would multitask with 256K RAM.
Obviously if you run huge applications memory usage goes up, but that is
not the OS's fault. A newer configuration with the bells&whistles
listed above will run in 1 MB. You can get real work done with 2MB.

# 1126. Re: Amigoids Like The Falcon, Too!

Newsgroup: comp.sys.atari.advocacy
Date: 1993-07-27 17:17:39 UTC
From: dhiggins@axion.bt.co.uk
Message-ID: <233nvj$6o1@zaphod.axion.bt.co.uk>
Source record: 22162

The Amiga is the only home computer which is BUILT on a multi-tasking operating system. The attempts of Atari and Microsoft to try and glue bits and bats onto a non-dynamic OS are pitiful. What you need to do is start at the most basic level and make EVERYTHING dynamic.

For example, I use Windows 3.1 at work, and while it is printing, I can do nothing. If I point and click, all I get is a beep. Were I using an Amiga, I could shufty my screens around and get on with something else.

The amount of thought that went into producing the Amiga GUI staggers me sometimes - I don't know if the Falcon has scrollbars like the Amiga's, but Windows certainly doesn't and it's a pain in the ass to use. The "scrollbar" is a square, so you can't tell roughly what portion of the view you're looking at.

Multi-TOS is a joke. Windows is hilarious at times. The only OS that comes close is the Archimedes - but I don't like it because it's so unstable it falls over if you sneeze too hard. Also, any sort of console input takes over the computer.

I remember when my friend proudly showed me his ST with spanking new blitterchip installed. "What software uses it?" I asked. "Well...er...this game does actually, and that's it". Laughed? I nearly died :-)

Dave.

Opinions are mine and all that guff.

## 1127. Atari's use of the word "built-in"

Newsgroup: comp.sys.atari.advocacy
Date: 1993-07-27 17:21:55 UTC
From: dhiggins@axion.bt.co.uk
Message-ID: <233o7j$6o1@zaphod.axion.bt.co.uk>
Source record: 22163

Does anybody remember when Atari claimed that the Falcon would have a "built-in" genlock? I saw it on a few advertisements. I later heard "It does have a genlock, you just need an adapter to convert it to video".

Hmmmm... my Amiga 1200 has a built-in modem - you just need an adapter to connect it to the phone line :-)

Dave.

Correction: The Amiga was designed first and foremost to be a game machine.
If I remember my history correctly, the original Amiga company was supposed
to be designing a killer game console that later turned into a computer,
and they fought hard to keep it from falling victim to corporate beauracracy
inside of C=.

The OS was also partially designed by Metacomco, right?

Granted, the Amiga shipped with a multitasking OS, but Intel based machines
have elegant solutions such as NeXTStep and Solaris. These operating systems
are much more capable (and demanding!) than AmigaDOS.

Well, i don't think the scrollbars on Windows are too bad. They function like
all the rest I've seen. The Atari GEM interface has a nice touch of being
able to represent the amount of data in the view by the size of your slider.
I've seen a LOT of Mac apps that don't even do that.

Whoops, we're confusing hardware and OS. True, the hardware was designed for games, but the OS was meant to be multitasking from the start.

> The OS was also partially designed by Metacomco, right?

Partially *written* by MCC, yes. Let's not use words like 'designed' here; I believe the basic reason for the instability of 1.0 was the incompatibility of MCC and C='s own code. And from 2.0 up, pretty much everything is C= :)

> Granted, the Amiga shipped with a multitasking OS, but Intel based machines

How many home computers that run Solaris or NeXTStep do you own? We're talking home computers, not workstations.

Apparently, proportional scrollbars scare the user (I'm serious, that's the reason Apple gives for not using them). The Amiga has (of course ;) had them from the very beginning.

I'm not sure if this was ever true. The CoCo uses OS-9 which is a
fully multi-tasking, resource friendly OS. Not to mention a CoCo is
an 8 bit computer. Apple's System 7 is multitasking to an extent, and
of course there's OS/2, Linux, etc. Granted, the Amiga has one of the
nicer multitasking OS's available for micros these days, but it's far
from alone (and far from perfect).

>For example, I use Windows 3.1 at work, and while it is printing, I can do

Type Alt-Tab and cycle through the icons until you come up to the
Program Manager, let go of the keys, and continue on with your work.
Don't confuse lack of knowing how to do something with not being able
to do it. I'm not saying I like Windows, I don't. There's no reason
to slam it for a problem that doesn't exist though.

>Amiga's, but Windows certainly doesn't and it's a pain in the ass to
>use. The "scrollbar" is a square, so you can't tell roughly what
>portion of the view you're looking at.

The part about the scroll bars that bother me is that they "snap" back
to their initial position if you move the cursor out of the bar
region. This becomes even more annoying at higher resolutions when
you have to be more accurate with the mouse.

That's true... i never meant to imply otherwise. The Amiga's initial release was so-so (i remember a friend who purchased the ST after being unable to get an Amiga demo to work properly back in '86 (i think it was then!) at the local store).

He eventually became the happy owner of an A1000 (refurbished) which he eventually upgraded to an A2000... which he then sold when he quit computing as a hobby. <he now uses a 486SX-based machine for graphics, games, and midi>

>Partially *written* by MCC, yes. Let's not use words like 'designed' here; I

I think it is becoming arguable as to what constitutes a workstation and what is not. I guess in terms of raw processing power, AmigaDOS runs on a wide range (68000-10-20-30-40), and the '040 is even now a workstation-class chip (just ask NeXT :) ).

I agree few users have NeXTStep/Intel or Solaris on their PCs relative to the great unwashed masses of DOS & Windows 3.1 users, but i would hazard a guess that they are a decent sized market.

>

Geez... Apple needs to rethink that. :)

The GEM AES has always been able to do that. Thank God for alternative OSes! :)

# 1132. Falcon BenchMarks

Newsgroup: comp.sys.atari.advocacy
Date: 1993-07-27 23:44:04 UTC
From: renfro@bnr.ca
Message-ID: <234ek4$4rj@crchh327.bnr.ca>
Source record: 22168

Several days ago I posted my intent to post some timings for loading
JPG files into a program called GEMView. I don't know if something
got fouled up with my news system, but I saw no follow-ups to my post.
I had hoped for someone to go out on a limb and take a guess at the
possible results. Oh well, I guess I'll just post the numbers and
we can hash it out from there.

The intent of this post is to shed some facts on the thoughts of some who
think the Falcon 030 is a crippled machine. I'm not into the details
of machine architectures, so I have no idea what to expect when comparing
the performance of a Mega ST (for example) to that of the Falcon (which
is why I was hoping someone might comment on that earlier). However,
from personal experience, I know that the Falcon is significantly faster
(granted a qualitative judgement) and more full featured in the graphics
area than the Mega ST. The following numbers will help quantify the
previous statement, but again I do not know if the results indicate if
the Falcon is as fast as it should(could, it's pretty relative anyway) be.

So here goes:
Loading a 424x480 JPG into GEMView in ST High mode (640x400)-
Falcon w/o MTOS MegaST w/ADSpeed (16MHz) MegaST @ 8MHz
--- --- ---
32.5 secs 57.2 secs 1:44.0 secs

Loading a 424x480 JPG into GEMView in 16 color 640x480 Falcon mode-
Falcon w/o MTOS Falcon w/MTOS
--- ---
1:11.7 secs 2:30.9 secs

Loading a 424x480 JPG into GEMView in 256 color 640x480 Falcon mode-
Falcon w/o MTOS Falcon w/MTOS
--- ---
1:28.5 secs 2:29.8 secs

Loading a 416x520 JPG into GEMView and then JPGVIEW in 640x480 256 color-
GEMView JPGVIEW (demo prg which uses DSP to process JPG)
--- ---
1:14.7 secs 7.37 secs

The last bit was to show just one significant use of the DSP for other
than audio purposes. What does all this mean? I guess that is up to
you to decide. To me, it just proves what I have felt for as long as
I have had my Falcon - it is a very useful and capable machine for
general home computing needs (and then some).

Randy

Sorry I cant offer any insight here, but I am wondering where to
get this JPGVIEW? does it work within Gemview or outside of it?
I havent tried to load any JPEG files into my Falcon yet, so I
cant comment on that. Loading GIFs, I notice a great difference
between my non-mega STe and my Falcon, tho (sorry, no hard numbers,
outside of, there is a great improvement)

Unless my docs are wrong, almost every program uses the blitter (Unless they have no text and graphics :), as The graphics routines in the OS (Line-A, which VDI uses) are written to use the blitter if it's there. I've never checked it out as I don't have a blitter, but I'm pretty sure you'd see a difference in speed with the blitter on or off in any apps.

Patrick.

It's possible to get any computer to multitask using the system that Windows or MultiTOS use. Even a BBC B can have a multitasking OS, if you can find the memory. However, the Amiga has the only pre-emptive multitasking system available on a home computer. This means that no one task can hog the processor because it was written badly.

Ok, just to clarify some points:

MiNT (hence, MultiTOS) does do pre-emptive multitasking.

So does AmigaDOS.

System 7/MultiFinder do NOT pre-emptively multitask. They use cooperative multitasking akin to the limited multitasking used when an ST owner runs several desk accessories along with a main application under single-tasking versions of TOS.

I think in terms of features, AmigaDOS is nice, and it has some things I'd like to see in Mint and GEM (in particular, the graphic interface is more closely integrated into the multitasking scheme.. the reason MultiTOS is slow is because the AES spends a lot of time in supervisor mode and MultiTOS won't stop a task in supervisor mode (i guess the logic is that when in supervisor mode, you cannot tell if the application is doing something timing sensitive?)) but this is fixable.... they just need to re-work the AES.

The biggest thing I wish AmigaDOS had was memory protection which is probably unreasonable considering most of their machines (as shipped) have no MMU. This would be nice so that programs don't go romping through all addressable memory corrupting the data of other running apps.

|>
|> Patrick.

Difference in speed???? How?

All that happens is that the CPU gives up the data bus to the blitter, the blitter does its stuff and gives the bus back to the CPU. The difference in speed gained is only the difference in speed of the CPU and blitter at whatever job it's performing. This sort of operation is the same as an Amiga with only CHIP RAM.

Now add some FAST RAM to the Amiga. Now the blitter can access CHIP RAM in the same clock cycle as the CPU accesses FAST RAM. That's the whole point of having a blitter chip in the Amiga and it's why Amigans rave on about it for hours on end.

Now consider that there are three custom chips in the Amiga - Agnus/Alice which handles memory moving operations (blitter) and the COPR, Denise/Lisa which handles graphics and Paula which does sound and disk drives. The Amiga can have a 68000 program running in FAST RAM, while the custom chips handle the I/O for it.

My Amiga 500 gained about a 30% increase in speed simply by adding FAST RAM - that's on top of any speed increase gained by simply having the blitter in the first place. I've now got a 1200 which goes like a rocket without FAST RAM, can't wait to get a memory expansion for that!

Also, because there has been a blitter in *every* Amiga ever released, programs can rely on it being present and use specialised blitter routines. These are the sorts of things that can draw BOBs at lightning speed.

It simply has to be said ... the Amiga is great.

Dave.

Opinions are mine only, and all that guff.

Well the difference here is that on the Atari, we'd rely on making calls to the operating system which would then determine whether or not the blitter kicked in or not. On a system with no blitter, our raster functions would be done in software. On a system with a blitter, the same functions would be offloaded to the blitter.

So I guess that says that every Atari program that does, oh, any raster op can use the Blitter too.. provided the author called the operating system.

Unless of course, you put a Forbid() in your program, then the system
is essentially in "co-operative mode". You're right to an extent, one
process can't take over the processor because the OS deals with the
task switching. If one "badly written" program decides to thrash
another process's memory, however, then the system will go down. As I
said before, the Amiga's OS is really nice, but there are a few
things missing. Incidentally, Linux, OS/2, and OS-9 are also fully
pre-emptive, so your other statement is incorrect as well.

>Well, what an intuitive system. Alt-Tab, of course, why didn't I think of that

No more or less intuitive than left-amiga-N/M if you ask me. Of
course, you can flip screens with the mouse, if the screen supports
system gadgets, but this alway's isn't the case.

One of the things I'd like to see is proper support for keys. If your mouse throws a wobbly on you, or you've got joysticks connected, the keyboard alternatives are a pain-in-the-ass to use. One good thing that can be said for Windows is that you can use it with the keyboard comfortably (even if you do get the nickname of "Mr.Hotkey" :-).

|>Incidentally, Linux, OS/2, and OS-9 are also fully
|> pre-emptive, so your other statement is incorrect as well.

I did say "home computer". How much would it cost to get a home system with OS/2 on it? More than the Amiga 600 at £199, you can bet.

In fact all Amiga screens *must* support system gadgets - except things like AMOS which take over the viewports and put them to their own use. It's simply that badly designed programs overlay a backdrop window over the screen bar and gadgets so that the gadgets are hidden. These programs are mostly games, demos or slideshow utilities etc. which you wouldn't want to flip out from anyway. The Amiga-N/M combination is there as a last resort, but I think there are *a lot* of Amiga owners who don't even know about those keys.

>

That's a pretty shortsighted statement... for one thing you're saying that most of these machines being sold today as home computers (i'm speaking of the 386/40s and 486SX25s and SX33s, as well as the 486DX boxes...) can't run a pre-emptive multitasking OS and that's simply not true.

The price of the clones, as well as performance issues gives you a machine that while it may cost more (#199 is about $400 US right? a 486SX25 with 80MB HD and 4MB of RAM is just $999, and that includes a monitor and SVGA), yields a much better machine. Out the box it can run Windows 3.1 adequately, and OS/2 should fit on such a configuration, though not as comfortably as AmigaDOS may on a HD-based Amiga.

Come to think of it, is it even useful to multitask on an A600 with no HD and 1MB of RAM in 1993?

(in my eyes, the machine of C='s future is the A1200, which i've seen as low as $429 US..)

You're right that the Amiga/Falcon debate is a waste of time. :)

Can you elaborate on the specs of this new Centris? Is it using a full-040
or the LC040 with no math coprocessor? Are the DSPs the AT&T 3210s hyped
by Amiga users? Also, what type of video and sound capabilities are involved?
Can it do 24-bit color out the box? And I'm assuming the audio should be at
or near Falcon quality.

I can certainly see where such a machine would threaten the markets of the
Falcon and A1200/4000 as it could penetrate both machine's niche markets
while offering the large base of 3rd party soft & hardware the Mac has....

On Monday August 2, the debate between the Falcon and the Amiga will be irelevant, when the new dsp macs will hit the stores in your neighborhood. The new Centris 660 AV powered by an 040(25 mhz) will list for $2139(8/80 config). This model will have two dsps for video and sound, geo ports(to emulate a fax modem) and will come with the casper voice recognition feature. These new Macs will make the Falcon and Amiga look sick. The debate between the Amiga and Falcon is a waste of time.

Yes, yes, but how much would it cost you to match the performance of, say a 1200
with 120MB HD (cost about £650, maybe a bit less)?

```
|>
|> The price of the clones, as well as performance issues gives you a machine
|> that while it may cost more (#199 is about $400 US right? a 486SX25 with

|> and OS/2 should fit on such a configuration, though not as comfortably
|> as AmigaDOS may on a HD-based Amiga.
```

Usually £199 translates to $199 in the computer world. Computer users her in the
UK are ripped off all the time when it comes to American products. First there's
VAT or duty, then there's shipping, then there's the UK dealer offering a
warranty.

```
I'm not saying that the Amiga 600 costs $199, I don't know what the price is in
the US.

Give sterling a few more decades and the exchange rate will be 1 dollar = 1 pound
anyway ;-)

|>
|> Come to think of it, is it even useful to multitask on an A600 with no
|> HD and 1MB of RAM in 1993?
|>

Certainly. You may be surprised to learn that there are some utilities on the
Amiga such as QMouse which take up as little as 3k, which is 0.3% on a 1MB
machine. Also the Amiga doesn't have to break memory off in large chunks of 8 or
```

16k like I think the Archimedes does (?).

Floppy drive speeds have come on leaps and bounds since FFS was introduced, and also with the built-in IDE interface it's now cheaper than ever to get a HD for the Amiga.

I lived with a 1MB A500 for years before I got greedy and wanted to run DPaint and AMOS in colourful screens at the same time. Then I bought a 2MB SIMM upgrade for my GVP hard drive which cost about £70 at the time, although they're cheaper now. Come to think of it, my 0.5MB expansion cost me £60 when I bought that!

What niche markets? The Amiga has a niche market in the US has a low-cost video
workstation, but in the UK I'd say the Amiga was mainly a home computer.

If you want figures the best people to ask are Amiga Format (UK mag), who do
reader surveys on equipment, use, software etc.

How is a machine that costs $2139 penetrate an Amiga market that is mostly made
up of A500s which cost £399 at time of release, and dropped to £250 before
production stopped? Not to mention the fact that Mac software prices are also
high...

Dave.

Well, for one thing, I don't see too many A500s on this side of the Atlantic being used as low cost video workstations any more. Most of the people I've met who do video work on Amigas use A2000 or better machines.

I'd say that the Mac Advocate who made said claim doesn't believe the Centris 660 AV is there to wipe out the Amiga 500... it's there to kill off the Amiga 4000/30 and Amiga 4000/040.

Considering there aren't that many C= dealers (or Atari dealers) compared to the number of Apple dealers (at least in the USA), i'd say that it's pretty likely that in a very short time, the AV macs could do pretty good.

(But, when you consider that a fully decked out 486 DX/2 66mhz machine goes for the same price, the Centris 660AV doesn't sound so good... that's why i'm waiting to see if this machine has enough memory, storage, etc... to make it worthwhile... for example, an 80MB hard drive is okay, but for $2000, i want more than that! A comparable 486 machine comes with a 212MB HD!)

Well I think system 7 looks better than MultiTOS. Except that Macintosh
software will never be capable of controlling proportional scroll bars
(i.e. on the mac, the size of a slider is always the same---it's always
square). Windoze has the same trouble. It feels awful.

Ok, it's Monday... and I would have expected the announcement of these new AV Macs to flood the media. What do I see? No TV ads. No print ads in any newspapers around here. Hmmm. Not even a quote from a famous personality in the computer industry saying that the Amiga and Atari are DEAD (with caps on, i might add) because of these new, oh-so-wonderful Macs.

Perhaps they'll kill us off next time. :)

With a utility called Click Change you can change the scroll bars
to proportional. I have only seen one program that has problems with it
this way. That is NCSA Telnet. Unfortunately I use it all the time, so
I can't use Proportional scroll bars (The problem is that it always says
that everything that is viewable is on the screen, which is not the case.
Then you must use the arrows to scroll around with). My main complaint
is that it never shows how much memory there is available without going
to about this machintosh. That is something I like having on the screen.
Probably a utility for this as well.

Later,
Rob Morton

Well. I think this is a lame place to talk about MACs, as most of us
here (I even have a mac . . .) dont care a whole damn lot. The debate
between Atari and Amiga has never been about world domination, but just
a heated debate between two somewhat similar small computer companies
offerings. I guess these MAC users (assholes?) guess that they can make
out lives better by diverting our attention from Atari/Amiga to their
"all powerful" Apples. I like my mac, and use it often. I amso use by
PC often. My Atari has just always been cool because of things it has
that the big companies dont. For me, the main thing has always been an
abundance of knowledgeable users, and a good amount of high quality
software for free (or cheap), whereas I have not seen this sort of thing
on my MAC/IBM.

(Also a big reason is that in the BBS world, the IBM and Apple BBSs
have always been pretty lame, with some exceptions. I dont all too many
BBSs anymore, but none of them I know about have nearly the greatness of
old BBSs ran on Atari 800s (and some cool Apple II BBSs). )

But, if we must talk about Apple here: they are having some trouble
and we will see a lot of price decreases in the future. IBM is biting
ther bullet and taking big losses to try to regain the marketshare it
once had, and to crush the clones (and in fact it is doing OK at this.
Compq is doing well, but many small clone companies are getting crushed.
IBM can afford to loose 8 or 9 billion a year if it means regaining
market share). So APPLE will have some real nice priced machines,
necessitated by the fact that they are loosing marketshare to windows
(as lame as windows is). I am even thinking of picking up a new MAC as
the prices drop.

However, the Centris 660AV is aimed more at Multimedia. This may be
a niche for Amiga, but not for Atari. The Apple still wont have MIDI
ports. And to the Amigas benefit, I doubt the 660 AV will be much good
at Genlocking/etc.

Of course, a 4/80 Centris 660AV will not even be suitable for
Multimedia, except as a "family" computer. Serious multimedia requires
at least say 16/400. I know people who arent happy with their 128/8000,

as high quality video is a very demanding media!

- mike

Well, I'd have to disagree in one respect... 64 bits means it will have
the ability to do 64-bit operations. :) Of course, I approached the
Jaguar claim of 64-bit RISC CPU with some caution, as I notice how
many games are touted as being "16 MEGS!" or "20 MEGS!" and they mean
megaBITS not megaBYTES.

As far as I can tell, it is indeed a true 64-bit RISC CPU optimized for
working in a game system, so it probably isn't a wonderful general purpose
processor. Also, they have a custom DSP in the machine to help their
audio system out. The posting in the EE Times gave some interesting
specs on how they made it a pretty flexible box in respect to how the CPU
power is divvied up....

(note: I'm an Atari advocate, but I'm still waiting to see a Jag ship,
because if it is indeed new 1993 technology, it's going to be a killer
system when/if software is made available)

: Oh, Greg, if only I could dig up some of your anti-Falcon, anti-Atari posts!

No need, I remember them well.

: (you are bashing Barrett for doing to the Amiga what YOU do to the Atari)

Big difference. I see flaws in the falcon, and if asked, am more than overjoyed to reveal them; I despise designers who willfully cripple architectures; it's like defacing a Picasso, in a way. The Falcon can still be a wonderful machine; it will NEVER be a wonderful architecture, though, if their designs continue in any kind of pattern.

: I remember saying the same thing to you about Atari... tsk...tsk... :)

The Atari won't die when Atari does, no. The falcon is at a very, very young stage, though, and that does make a difference.

: Hmmm......is that why you stopped posting to Atari newsgroups, Greg? :)

I never "posted" to atari newsgroups, per-se. I don't read them, I've never sub'ed 'em. I merely responded, followed up on posts that were crossposted between the two.

If I happened to be the center of discussion in an Atari group, well hell, that's just fine. :) I was when I owned my ST, why not now. I wasn't nearly as much an advocate of the ST, though; matter of factly, I wasn't an ST advocate at all. Nor an Apple one. Nor a Mac one, for the one I owned. My Amiga seems to bring out the best and/or worst in me, I'd say.

I really, really, really think it's just this newsgroup. Then again, I was more than just a bit of a cynic, as I'm told, before I came here. I've actually been told that I'm FRIENDLIER than I used to be, get that. To think, I was once more caustic than I am now, mellowing with age like a stored bottle of nitro-glycerine.

: Basically Greg, you've just repudiated everything you ever did in
: comp.sys.atari.advocacy....

Funny, considering I really didn't do much there...

: (re: Falcon sucks due to 16-bit CPU access to RAM, DSP not important,

The falcon is INCREDIBLY crippled both by its access, which will get worse as newer processors (such as the 040) are used, and by its motherboard addressing. The DSP is hit hardest by the simple fact that

they used a 56001, and built it in such a way that it becomes a
single-user commodity, deadlocked into its own little universe, and then
made it the control focus for the system's audio abilities; this isn't
such a bad thing when it's multi-user, but a single-user DSP being used
by the OS as the audio system creates a question: Does it belong to the
user-level, or does it belong to the OS? Atari would have you believe
both, and in the end, you suffer for it.

: Atari financially strapped, Jaguar will lead to Falcon's demise, etc..
: etc.. ad infinitum, ad naseum...)

Jaguar _COULD_ lead to Atari dropping the Falcon; I don't really believe
that any more, but it IS a possibility. If the market got really bad,
and they had to choose which would survive, they COULD choose the Jaguar,
their likely choice due to their latest "direction" from within the
company, the "grassroots" movement toward game systems.

: Go ahead and flame this guy, but a lot of similar behavior is exhibited by
: Amiga advocates in other newsgroups... i don't see why he has a cult of
: Amiga owners flaming him... there are (gasp!) kill files!

Kill files grant people permission to talk behind your back; I refuse to
give that to anyone.

Greg

Therein lies your similarity to Mr. Barrett. You are looking for flaws in
the Falcon to make the investment you have in Amiga hardware look more and
more sensible. However, if you get right down to it, and if you look in
this newsgroup, you'll see close to 100 posts by you arguing one single
thing over and over.

How is this different from the guy everyone else wanted to censor?

I think it is always interesting to argue these points, but it seems silly for
the same people who bash other platforms to get so defensive when they get
bashed back.

Greg, let me fix this little misconception right now:

The Falcon's 56001 DSP (33mhz) does not handle the audio system. The 8-channel
sound system is a DMA based one that can do sample playback at various fixed
rates, up to 50khz. The DSP is simply there to apply real time effects or
perform transformations on the audio data being pumped to that DMA system.

Now, in the face of that fact, what else can you say?

"I am NOT Marc Barrett!" - Greg

:)

See, that's NOT the reason. You can bet your ass that if C= ever
crippled anything that came out of their doors in an overt and obvious
manner, I'd instantly be down their throat. This isn't a thing about
companies; this is a thing about architectures, and keep it at that.

Architectures are like art, like rare paintings. Each architecture holds
something that can be learned from it, something worth looking at,
something to examine. Crippling something is like tearing that painting
in half, cutting off one's head for the sake of weight loss.

: this newsgroup, you'll see close to 100 posts by you arguing one single

Umm, I was rather against that, too. I don't want to censor him, and I
don't believe he SHOULD be censored. However, reading his posts, you've
got to wonder how much is fact, and how much is passive-voice
shenannigans.

: Greg, let me fix this little misconception right now:

I was relatively sure, both from documentation, as well as from users,
that without the DSP, you got two-channel, 16-bit audio. The OS provides
the 8-channels by invisibly making use of the DSP through the operating
system.

Is or isn't that true?

: Now, in the face of that fact, what else can you say?

If it's a fact, then I'm sorry; but I was told more than a few times that
THAT isn't the way it is.

## 1164. Falcon yet to be seen

Newsgroup: comp.sys.atari.advocacy
Date: 1993-08-12 02:34:19 UTC
From: ghollard@gandalf.otago.ac.nz
Message-ID: <ghollard.1.745122859@gandalf.otago.ac.nz>
Source record: 22100

Early this year I read an article in an STformat with all the pre-release specs for the Falcon which was to be released onto the british market before the New year (i.e. 1993), I was taken by the features that this machine had built-in that other machines had only as expensive optional extra's. I waited and waited for any sign of this machine becoming available here (New Zealand) and finally in late April/early may there was a small add (4 lines) in the classified section of the local paper placed by an unknown electrician company who where the only people who where doing any sort of sales for atari's here. The person I was put through to in their company was very helpful(so he should be, I was going to buy one of these computers.) and he gave me all the information he had on the machine, which was not much more than what I had all ready gathered.

It is now late-August, the falcon was due for release in July, 7 months after it was released in Britian, and it seems no closer than before. I could (according to the salesman) get one imported from Australia where they have been on the market for sometime, but Atari would not do this, I would have to pay all the customs and freight etc.

THIS REALLY SUCKS. IF ATARI CAN'T GET THERE A INTO G AND IMPORT THEIR "BRILLIANT" MACHINE HERE, THEN I'M NOT BUYING THEIR COMPUTER, NO MATTER HOW GOOD IT IS.

I already own two atari's and was looking forward to getting to program this machine, but stuff it, I'm not waiting forever.

I could get a 486DX2 for the cost of a falcon imported from Australia.

Well, thats my gripe over.

Greg Hollard
One VERY disgruntled Atari owner.

## 1165. Atari FALCON 030 (accurate news)

Newsgroup: comp.sys.atari.advocacy
Date: 1993-08-13 17:05:36 UTC
From: mcookson@flute.calpoly.edu
Message-ID: <1993Aug13.170536.117834@zeus.calpoly.edu>
Source record: 22101

Well, I was almost convinced by all the bullshit that the Falcon was heavily crippeled. But . . .

Now I am more apt to think that the Amiga fanatics, in particular (in fact only) those who are raising all this hell about crippled architecture are full of shit.

This info is from the Falcon 030 "ad" from Atari.

System Architecture:
CPU Motorolla 030 at 16MHz
on chip demand-paged MMU
256 byte instruction cache
256 byte data cache
Independant data and address busses (yeah this one is stupid - almost all comps. have ind. data and address busses)
Pipelined architecture (doesnt mean too much)
*** BUS: 32 bit data bus
*** BUS: 32 bit address bus
FPU: optional 68881/2
RAM: 1, 4, 14MB configs
ROM: 512kByte (and 128KB cartridge )

Anyhow, unless this ad is lying, there is a full 32 bit data bus. I have not opened one up yet, but I trust Ataris info better than the stuff here. There is no way they could claim to have a 32 bit data bus if they were really using 16.

Now, I havent followed everything here completely. I would believe that there is only an 8 bit bus to the cartridge (more than likely). Maybe even a 16 or 8 bit bus to some support components. BUT the 030 to the RAM must be 32 bits, which is what is going to matter on a computer like the Falcon.

Flame away if I missed somenthing, but either the falcon has a 32 but data bus or Atari is lying. Someone open up their Falcon and take a look.

So, to you Amigaians complaining about crippled architecture: Of course there are still probably aspects of the architecture that are crippled. But this is true in every computer, so get off your lofty idealistic trip. For example, all IBMs except the PS/2 and some newer clones are SERIOUSLY crippled with slow busses (4 or 8 MHZ) and so on. Even EISA sucks. This is a much bigger problem for an IBM, as they rely on the expansion cards for a lot of work. The PS/2 (Microchannel) is a fairly uncrippled machine, but costs a fortune to buy and upgrade. Same

is true ofmost computers. If you want the ideal, uncrippled computer, go buy a good cray computer.

I cant say in what ways the Amiga is crippled (I dont have one, I do have an ST, Mac, and IBM PS/2). I am sure there are things here and there on it that could be better. I personally would even like having an Amiga. I guess I am not as closed minded as some. Until some PC comes out and gain acceptance that is vastly supperior to the current ones, I feel there is an advantage in having multiple types of computers. I use the Mac of DTP, WP, Database. I use the IBM for programming mostly. I use the ST for Telecom, TeX (good on the ST and IBM, sucks on the MAC for some reason), some DTP, and general doping around. I WOULD use an Amiga for Genlocking and some other uses.

Anyhow, enough garble. I now feel that the rumours here about a 16 bit bus were probably BS. I wouldnt risk my life on that yet, but in any case it seems that there is a lot of garbage posted here on speculation and (closed minded) opinion.

For the Atari crowd, a few other points from the ad:

32Mhz 56001 DSP - 16 MIPS - 32kword (64kbyte) static RAM - ext. connector

Expansion bus: direct processor slot. (listed as good for 486SX expansion in the future, DMA co processors, etc)

SVGA (well 640x480x256). 16 bit color in one mode. Accepts external sync for genlock. Overlay mode. Blitter chip.

sound: 8 16 bit DMA. record/play at 50kHz. stereo in/out. Coproc (DMA)

SCSI II, LAN (localtalk), VGA, RF, Cartridge, Stereo in/out, joystick (2), 2 15-pin d/a controller/light pen connectors.

1.44MB drive. Internal IDE port (drive optional)

INCLUDES KEYBOARD (Ahahaha)

Pre-emptive multitasking with adaptive prioritization.

IPC through pipes and MultiTos

TOS in ROM (I think 4.x)

Well thats it. Bye!

- mike

The above sounds like a description of the CPU itself. It has 32 bit data/address buses. What Atari does with those may not be mentioned in the ad. I don't know, nor really care what the case is, but it is one possibility. After reading the Indigo Indy press copy I suspect anything that comes out from advertising hacks.

> Anyhow, unless this ad is lying, there is a full 32 bit data bus. I

The ad would not be lying, just misleading if the above meaning was what they meant.

I don't know for sure, but I have been under the impression (and still am) that only a portion of the data bus is 16-bit, and that portion would be CPU---COMBEL. The other chips on the data bus would then have 32-bit access to the memory.

Note that I could be very wrong, but this is what I believe. I still agree that claiming such a bus a 32-bit bus isn't very fair.

Where do you live, in what country? It's shipping here in Oakland, Ca, USA and has been for MONTHS! My local Atari Dealer has sold more than 50 already, and more are on their way. The Falcon is DEFINATELY worth waiting for.

I don't have one *YET* but I'm saving up like all my other friends. If you look around on the Main Atari BBS systems in the Bay Area, you'll see "Selling my 1040 STe to by a Falcon" messages all over the place!

Sure, the 68030 is 32/32, but the Falcon implementation is 16data/24adr.
As posted earlier, this sounds like an advertising gimmick.

>Now, I havent followed everything here completely. I would believe
>that there is only an 8 bit bus to the cartridge (more than likely).

Very UNLIKELY in fact. Only PC's have 8-bit buses anywhere these
days (since they are Intel based). All chips (except CPU) have 32-bit access
to RAM. This is ESSENTIAL to display TrueColour!

I think it probably is an attempt to emphasize the 32-bit data bus between
the custom chips and RAM... after all, they would be shooting themselves
in the foot (advertising wise) to say it is a 16/32 bit bus.

# 1172. Falcon stats, anyone?

Is this machine worth getting? I do NOT want answers from all the
idiots with loud opinions and no direct experience with the machine.
I have only recently (last week) found out that the Falcon exists, and
can find no reviews except for a Jan/Feb issue of Atari Explorer.
(it's August. is this a sign?) The machine seems to be quite a godsend
to those wishing to do multimedia (MIDI, digital audio, video?) for cheap.
What benchmarks have been run and what do they show? Someone posted an
impressive note in c.s.a.st about a DEC competition of several machines
running a mandelbrot set demo with the Alpha PC beating the pants off
a Mac Quadra and yet a Falcon beating the Alpha.
Is this realistic and/or even valid? (it may not have been the same
code ...) There are a lot of naysayers in c.s.a.s.tech claiming that
the Falcon is a dog, with the mouse interrupts eating up 30% of the
CPU bandwidth. I really don't want to upgrade to something as slow and
annoying to program as my old Mac POS (an original SE; the one with
the fan from hell) and I'm certain there are those of you acquainted
with both environments; what do you think? Am I best off just getting
a new 68040 Mac (I shudder to think)? Or is the Atari in-ROM OS sleek
enough and Sys7 slow enough to make a 68040 and 68030 look compatible?

email replies might be more appropriate than starting a mudfight.

Thanks,

# 1173. Re: Atari FALCON 030 (accurate news)

Newsgroup: comp.sys.atari.advocacy
Date: 1993-08-16 22:48:58 UTC
From: mcookson@flute.calpoly.edu
Message-ID: <1993Aug16.224858.174547@zeus.calpoly.edu>
Source record: 22109

Well, hopefully the original yelling match about the bus wont start up again. I posted my message in regards to the add I saw. I have since been enlightened to some of the cool features of the 030 (I have designed with a 68000, but not an 030).

So if anyone cares:

The Falcon does use a 16 bit bus to memory. But, this does not mean, as I originally said, that the memory would have to be either externally multiplexed or the software crippled to disallow 32 bit accesses (the second being basically unthinkable).

But, the 030 uses signals from the memory controller to determine the data bus size. So, the memory controller need only assert/deassert the correct signals, and the 030 will adapt itself to a smaller bus. (i.e. a 32 bit access would be done in two 16 bit reads).

Atari claims to have a 32 bit bus, because apparently some of the computer uses a true 32 bit bus. The memory, however, is 16 bits. This, however, is not as horrible as most have made it out to be. Each 32 bit read will take 2 bus cycles to read the 32 bits. However, this does not half the speed of memory access, as there are other bus cycles in each intruction (fetch, etc), and if those are 16 bits, they do not double in time.

It is deffinately not ideal. But the more important point is raised. If you want the extra speed, you could redo the memory and the memory controller, which isn't that hard. (In fact there are expansions that do this).

Anyhow, enough of that. If I buy a Falcon (they are readily available for $799 in this area), I will worry about it. Regardless, benchmarks have shown that the memory access is not too bad. But if you want a power-falcon, it should be easy enough to change.

- mike

There goes half the net population :-) I've seen the Falcon (at the
MiST show) and used it a little, so I'll give it a shot (there's others on
the net that already *have* Falcons so they may be more helpful)...

>I have only recently (last week) found out that the Falcon exists, and
>can find no reviews except for a Jan/Feb issue of Atari Explorer.

Check out the last couple issues of Atari Explorer Online (available
at atari.archive.umich.edu and mirrors such as wuarchive.wustl.edu).
I believe at least one or two of them have a bunch of specs on the Falcon.
There's also a file in the atari/Falcon directory of atari.archive and
the mirrors that has the specs by themselves, if I remember right.
Just an FTP away :-)

>(it's August. is this a sign?)

It's Atari's latest slogan: "Real Soon Now..." ;-)

>The machine seems to be quite a godsend
>to those wishing to do multimedia (MIDI, digital audio, video?) for cheap.
>What benchmarks have been run and what do they show? Someone posted an
>impressive note in c.s.a.st about a DEC competition of several machines
>running a mandelbrot set demo with the Alpha PC beating the pants off
>a Mac Quadra and yet a Falcon beating the Alpha.
>Is this realistic and/or even valid? (it may not have been the same
>code ...)

Benchmarks are a very deceiving thing. For one, different code could
have been used. Different hardware could have been used (remember, comparing
a DSP against a non-DSP is like comparing Apples-and-Ataris :-) Come to
think of it, it could even depend on the COMPILER that made the benchmark
program. Benchmarks are like statistics - they can be manipulated in many
ways (this is apparently what got DEC ticked off - from what I read
DEC was using the Mandelbrot as "proof of power" and the Falcon beat it -
I dunno if there *is* such a thing as a true comparison among machines,
other than just sitting down at each and seeing what they can do...

>There are a lot of naysayers in c.s.a.s.tech claiming that
>the Falcon is a dog, with the mouse interrupts eating up 30% of the
>CPU bandwidth. I really don't want to upgrade to something as slow and
>annoying to program as my old Mac POS (an original SE; the one with
>the fan from hell) and I'm certain there are those of you acquainted

>with both environments; what do you think?

NAY NAY NAY (sorry, couldn't help it :-)

If anything, it's MultiTOS which is slowing down the Falcon (probably similar to how MiNT would slow down a MegaSTe). You don't *need* to have MultiTOS running (my 16mhz 68000 MegaSTe hums along quite nicely - I'd imagine a 16mhz 68030 should do even better). Getting a screen accelerator like NVDI or Warp 9 (assuming there's a Falcon version) should make a significant difference as well (it has on my MSTE).

On the ? side, there is supposed to be a German company coming out with a 33mhz 68030 expansion for the Falcon - would probably kick the speed up nicely...

>Am I best off just getting
>a new 68040 Mac (I shudder to think)? Or is the Atari in-ROM OS sleek
>enough and Sys7 slow enough to make a 68040 and 68030 look compatible?

Depends on your needs. Oh, the main TOS is as always built into ROM. MultiTOS extensions are loaded in if you want them in memory. If you do go Falcon, might want to start out at 4 megs (though 14 megs would be a nice start as well :-)

>email replies might be more appropriate than starting a mudfight.

Maybe a foodfight will result (as the apple puns start slipping in :-)

>>that there is only an 8 bit bus to the cartridge (more than likely).

>Very UNLIKELY in fact. Only PC's have 8-bit buses anywhere these
>days (since they are Intel based). All chips (except CPU) have 32-bit access
>to RAM. This is ESSENTIAL to display TrueColour!

Excuse me, but I couldn't let this pass.

Only PCs older than the origional ST are still 8-bit. You will find that
most new PCs are at least 16 bit, with most smart buyers only purchasing 32
bit machines. (and this is only the expansion bus system. All 386 & 486
machines are 32bit internal and external.)

And True colour is 24 bit - 16.7million colours, and there are plenty of
16-bit PC cards capable of true colour, you don't need a wide bus for true,
colour, you just need more memory.

Chris.

Source record: 22112

While I do not have experience with the Falcon I have been using
Multi-TOS and the new AES on my TT for seven months now. All I can say
is this is my choice for a GUI. The look and feel of the system is 100
times better than previous versions of TOS.

Major new additions to the AES are iconization of windows, walking menus
the much touted 3D buttons and color icons. While the walking menus
are not used on the desktop the addition of these other features really
add to the refined feeling of the desktop. With the beta release of
Multi-TOS 1.08/AES 4.1, the last of my compatability problems have
basically vanished.

Additonally if you like a windows based Unix feel, go to the the archives
and get all the MiNT utilities. It is nice to have a couple TCSH shells
up and running, though a much larger screen than my TT's 640x480 is
really required.

Since at work I get to use Macs, and PC/Windoze, along with my HP-720
workstation, I have plenty to choose from, and still I'll take my TT
with Multi-TOS/AES over either the Mac or the PC/Windoze, it is just
easier to use. I prefer the HP-720/HPVue over the TT, but that mainly
has to do with the mouse cut/paste features, of course 1280x1024x8 doesn't
hurt either.

I will admit that drawing text seemed slow in early versions of the
AES, but the ones released since June are a large improvement. What I
would like to see added is an improved version of cut/paste with the
mouse, and multiple desktop screens similar to HPVue or PC Dashboard,
though you can get two desktops simultaneously by using NeoDesk as the
alternate.

Other than that I would like 1280x1024x8 video adapter, but I'm saving
my money right now, for a Falcon. They cost the same :)

Brian

Mark Cookson (mcookson@flute.calpoly.edu) wrote:
: Well, I was almost convinced by all the bullshit that the Falcon was
: heavily crippeled. But . . .
:
: Now I am more apt to think that the Amiga fanatics, in particular (in
: fact only) those who are raising all this hell about crippled
: architecture are full of shit.

A 030 chip doesn't like to work on a 16bit bus. The benchmarks would
indicate that it is working on a 16bit data bus. I've used a 030 board
in an Amiga with 16bit ram, and without 32 bit ram, the speed improvement
wasn't as great as an A3000, which is a 32bit bus computer.

: This info is from the Falcon 030 "ad" from Atari.
:
: System Architecture:
: CPU Motorolla 030 at 16MHz
: on chip demand-paged MMU
: 256 byte instruction cache
: 256 byte data cache
: Independant data and address busses (yeah this one is stupid -
: almost all comps. have ind. data and address busses)
: Pipelined architecture (doesnt mean too much)
: *** BUS: 32 bit data bus
: *** BUS: 32 bit address bus

I think they're talking about the actual 68030 chip, not the actual
Falcon's address bus itself. If it was 32 bit address bus, then you
could put in 2^32 (512MB of ram). From memory, it was only 16mb (which
is still a lot of memory for this class of computer) .

: FPU: optional 68881/2
: RAM: 1, 4, 14MB configs
: ROM: 512kByte (and 128KB cartridge )
:
: Anyhow, unless this ad is lying, there is a full 32 bit data bus. I
: have not opened one up yet, but I trust Ataris info better than the
: stuff here. There is no way they could claim to have a 32 bit data bus
: if they were really using 16.

Just like they couldn't claim that the Amiga1200 used a Motorola 68000
just like the the Atari 520ST?

: Now, I havent followed everything here completely. I would believe
: that there is only an 8 bit bus to the cartridge (more than likely).
: Maybe even a 16 or 8 bit bus to some support components. BUT the 030 to

: the RAM must be 32 bits, which is what is going to matter on a computer
: like the Falcon.

I think the combel (?comdel) to ram is a 16 bit access, but combdel to
custom chips is 32 bit access.

|> Is this machine worth getting? I do NOT want answers from all the
<rest deleted>

If you like STs (even a little) then the Falcon is definately worth getting. I have had one for a month now and I am very impressed with its capabilities, though the Falcon specific software is still a bit scarce. It does run most of the ST software in the appropriate compatability mode (and perhaps with some support software), so there is plenty that can be run on it.

A couple weeks ago I posted some timings comparing a JPEG loading and displaying program on the MegaST and the Falcon. The MegaST has a 16MHz ADSpeed in it, but only a SM124 monochrome monitor. To be fair, I ran the same program on the Falcon in ST High mode. Anyway, the timings showed that the 16Mhz Falcon was almost twice as fast as the 16MHz add-on MegaST.

As was pointed out by Brian Grier, the look and feel of the new TOS/AES is great and of course all the new video modes are impressive. For an extra $100.00 you can get a Screenblaster and boost resolution to 1024x768 or more (if you have the right monitor). MTOS is good, but it does slow things down a bit. My understand is that this is mostly due to the way the AES is written and could be fixed in the future. Don't know how much NVDI will help, as I am still saving up to get it.

Also, I just picked up a microphone and stereo plug (for a cd player) this weekend and started playing with some of the audio capabilities. This also was quite impressive (to me anyway, since I haven't done any recording/ sampling in the past). I just plugged in the mic or cd line out and using one of several programs that came with the machine I could record to memory or direct to disk at various frequencies 8/16 bit stereo or mono. My wife recorded several samples with the DSP doing an echo effect and then I assigned them to system events using the System Audio Manager (also included). Not sure this is such a great idea though, as you may not want your wife's voice nagging you from the computers speakers as well as in real life.

Anyway, it is a great machine for all kinds of purposes and I am having a lot of fun playing with all it's features and even getting some work done too.

>No way what ever, the FALCON is a DEAD computer, only 1000-2000 sold world wide
>I would think there are more 'TT's' than Falcons out there and we don't have a
>'TT' group...

Let's see, how long has the Falcon been AVAILABLE for purchase worldwide
as well as in the U.S.? Kinda hard to sell a bunch when they haven't
been available up till relatively recently. If your forcast of doom holds
true in a year or two, then it might reflect reality...

As for a "Falcon" group, once more Falcon-specific threads develop
(maybe DSP-specific, etc) then the bandwidth would make it worthwhile.
For now, I dunno if it's needed to be broken off yet...

>Just live with the facts that the FALCON is Dead, it has a -100% performance
>rating, has far to many Bugs, no True colour in High res modes, has Big
>problems in Interlace modes, screen comes up scrambled very little software
>support, and I could go on and on...gee and the Price, what a rip off..!!

Hmmm, where to start...

- well, already got the "Falcon is dead" comment (sure glad you're
not my doctor: "I'm sorry sir, but I have to inform you you've died
a year ago..." ;-)

- -100% performance - uh, you DID plug it in, right? kinda kills performance
when there's no power to the system :-) Besides, it's probably MiNT
that's slowing the system down - you know, the Falcon doesn't HAVE
to run in multitasking mode (check out Mac System7 or Windows 3.x on
a 16mhz system and see what happens)...

- has too many bugs - what do you consider a "bug" - lack of compatibility
with some software (like games) or something more "true-to-bug-form"
like the ST series' infamous RTS/CTS problems? just curious...

- misc screen stuff - dunno about the true color; what kind of "big
problems" in interlace mode (other than the fact it IS interlaced)?;
dunno about scrambled screen (what kind of monitor attached and res
did you try?)

- little software support - again, 1) it JUST came out, gotta give
developers time to do something with the hardware; and 2) MOST
good software (exception of games) should have no problem with the
Falcon - some of the compatibility issues arise dependent on what
resolution you're in (as many ST games limit themselves to ST resolutions)
if you have Multitasking loaded, etc; programs like ConNect, STalker,

Gemview, Word WriterST, Atariworks, Calamus, etc should work fine
even in multitasking high-res modes

- price: yes, it would be nice if it were cheaper, since the clone wars
have dropped PC prices (and dealer profits :-) so that the ST's
big price advantage against the competitors is not so blatant as
it used to be; then again, didn't the first 1040ST come out for
around $1000, the first Atari 8-bits (800's in particular) for
$800 or so - the price will drop in time as they always have...

>Facts not Fiction...!!!!

- how about OPINION? (just as my message above is)

>Roger..... sheppard_r@kosmos.wcc.govt.nz

What's got you so hot about Atari lately, Roger? You're beginning
to make Darek look like a happy camper (now I did it - now I'll get
Darek's wrath either here or on his GEnie RTC tonight :-) Please,
Darek, I was just kidding, no, no , aiiiiiiiiiiiiiiiiiyyyyyeeeeeee :-O

Commodore's marketing is something else. They are driving towards something that has harmed Atari for the longest time, the game image.

Commodore's CD-32 is not just a CD-32, it is an "Amiga CD-32" game system. This means that Commodore is placing their games and their computers in the same category--entertainment.

We all know that Amiga has been known for its game image, but it isn't something Commodore should want to promote.

Isn't it funny how both companies are doing exactly the opposite of what they should be doing?

Commodore should be pushing the "Amiga" name for its computers and a slick sounding game like "Future Technologies" for its video games.

Atari should be pushing the "Atari" name for its video games and another professional sounding name for its computers like "Phoenix" or something like that with a completely different consumer view.

But, Commodore made the "Amiga" name to get rid of its game image with the C-64 and now they are bringing it back. Atari kept the name "Atari" because they felt image meant nothing and they were wrong.

Yes, marketing is nearly everything.

>Commodore's marketing is something else. They are driving towards something
>that has harmed Atari for the longest time, the game image.

People play games on PC's, but you don't see people calling them "game machines". I think you are not giving people enough credit for being able to tell the difference between a dedicated gaming or home entertainment device and a computer.

>Commodore's CD-32 is not just a CD-32, it is an "Amiga CD-32" game
>system. This means that Commodore is placing their games and their computers
>in the same category--entertainment.

No, they are using a lesson learned from CDTV. You build on an established name. "Amiga" is a relatively well-known brand name in their biggest market, Europe.

>Commodore should be pushing the "Amiga" name for its computers and a slick
>sounding game like "Future Technologies" for its video games.

Hmmmmmm.......I think that name is already taken. Does 3D0 mean anything to you?

>Atari should be pushing the "Atari" name for its video games and another
>professional sounding name for its computers like "Phoenix" or something like
>that with a completely different consumer view.

Again, given Atari's lack of capital, they decided to build on a recognisable name.

>Yes, marketing is nearly everything.

It helps....have you gotten your CD32 press kit from Commodore USA yet?

Because of the American market being MS-DOS dominated we would only be able
to work the machine into video markets. Bringing out a game system will not
hurt that. Also by keeping the Amiga name attached to it, they are setting
them selves up for people using CD^32's as a display unit in multimedia and
Kiosks. The question now is will they go ahead and spike it or get rejected.
[Out a here]
>
>Commodore should be pushing the "Amiga" name for its computers and a slick

I disagree. The CDTV was trying to avoid the Amiga name, and it was not a
success. I think the Amiga should be a multimedia developement computer for
the CD^32. That is not all it should be of course, but it would be a major
benifit.
>Atari should be pushing the "Atari" name for its video games and another

When you have a user base, you do not try hiding from them. You let them
know that the company they supported is growing and developing.
>

I assume you do not know much about the Amiga's history. C= did not have
anything to do with the name, except keeping it after the bought it.
>
>
>Yes, marketing is nearly everything.
>
Yes, and no matter what they name is with a good enough advertising
campaign the CD^32 can do well. Of course with a good enough advertising
campaign in 1985-1988, you would be hearing about C= and IBM teaming up
to make the next generation computer, not Apple. We had the edge, we
still have the edge, but the have the money to shove their crap so far
down your throat that they can convince people that they need it. Kind

of like a lesser Microsoft.

At least C= is driving towards something! (They've needed a focus for a long
time..)

A bit of reality for you: most people buy Amigas for games, video, and
programming. A game image will not harm any of these markets.

C= has tried ignoring the Amiga's game heritage in the U.S., and the
only thing they accomplished was getting most of the US entertainment
software companies to ignore the Amiga as a game machine. Ooops.

I'd bet that Atari's image was hurt more by their lack of advertising
than anything else. In the USA, nothing is going to be wildly
successful without some sort of promotion, with Atari and Commodore
being perfect case studies. To paraphrase an old quote "An ounce of
marketing is worth a pound of sales."

>Commodore's CD-32 is not just a CD-32, it is an "Amiga CD-32" game
>system. This means that Commodore is placing their games and their
>computers in the same category--entertainment.

The "Amiga" part of the name is fine, it's the "Commodore" part that
scares me. I wish they'd go back to the policy used for the A1000
and mention the name "Commodore" as little as possible. I cannot tell
you how pissed off I used to become when bozos would tell me about
their stupid C=64's as if they had something in common with me...

>We all know that Amiga has been known for its game image, but it
>isn't something Commodore should want to promote.

At this point, I'd be happy if they'd promote anything. I've been
hoping that they'd market an Amiga game console for years, and now
I just hope that it's not too late.

>Isn't it funny how both companies are doing exactly the opposite of
>what they should be doing?

When death is staring you in the face, you'll do almost anything. The
sad thing is that neither company appears to have the resources to
mount an effective advertising campaign.

>Commodore should be pushing the "Amiga" name for its computers and a
>slick sounding game like "Future Technologies" for its video games.

Ugh. I'd like to see them use the Amiga name for the 68k/ECS/AGA
machines, and come up with something new for the AAA/RISC machines.

>Atari should be pushing the "Atari" name for its video games and
>another professional sounding name for its computers like "Phoenix"

Commodore's mistake is continuing to put their name on the Amiga,
and unfortunately they will probably use it on the CD32.

>Yes, marketing is nearly everything.

It is everything.

I felt exactly the same way back then. I hated seeing the Amiga mentioned
in the same breath (or even in the same hour) as the C-64.

Actually, this validates this guy's point. Much as people like you and I
hated being reminded of the C-64 back when the A1000 came out, the Amiga has
everything in common with the C-64 now. The Amiga has become the C-64, for
all practical purposes. High-end Amigas are so uncompetitive that they might
as well not even exist, and the only place where the Commodore is at all
competitive with the Amiga is in the extreme low-end, with the $500 A1200
and the $200 A600. In fact, the Amiga is now worse than the C64. Commodore
killed their attempt at a "console" C64 (the "Max Machine"), but is going
full-speed-ahead with a console Amiga, the CD32.

Actually Commodore did try to seperate the Amiga from the "Commodore" name,
this was a well publicized issue.

I think your missing something here . The c-64 sold 15 MILLION systems
now if the Amiga CD-32 would sell just 2 or 3 million in the U.S you
would see a Renaissance of Amiga in this country and we would finally
be able to claim that there is a market for amiga products in this
country. Maybe we dont need to be the "serious" computer and we cant be
because there 75 million MS dos clones on this planet that we simply
cannot compete on price or performance in what they do best which is
BUSINESS systems. Where Amiga has edge is in Games,Multimedia,TV
production,and video. Now none of these markets except for games has

over million customers in the US. The Amiga in Europe is marketed as a game machine and it did fairly well

I think you need to realize if there are 5 years from now 10 million cd-32 systems around that someone will want to upgrade to do real computer stuff and thats where the market for sophisticated stuff will thrive. I care not if 80% of the people are using their systems to play games,as long as i can get my hands on oh say DELUXE PAINT V or Civilization II or PROWRITE 4.0. People who buy the CD-32 in the US are going to have the kind of disposable income they need to upgrade their system with a KEYBOARD,DISK DRIVES and software.

If CD-32 fails commodore wil fail

IF CD-32 succeeds,your only problem is going to be having to deal with all the 11 year-olds whining about why their favorite platform game is sold out and having to wait in line to read your favorite amiga mags and laughing as the value of the Sega CD and super Nintendo systems go through the floor,snickering as you hear that nintendo may have 32 bit game system in 1995!. I only hope they dont forget to put a PCMIA slot in there for cartridge style games

3DO (vapour, and expensive at that), Jaguar (vapour, don't know anything
else about it)... Face it, people are still playing with 8-bit NESs.
The CD32 is the cutting edge of technology to most gameheads.

Well, here's some info on the Jaguar:
(this is a repost {sorry} of a posting in c.s.a.st earlier today. I expected it to be here anyway, but obviously not... The commentary is not mine.)

Okay, folks. At last, we've got a first-hand account of a live sighting of the Atari Jaguar! Coming fresh from the machine's official rollout on August 18th, the following is an electronic chat between Chris Millar of Delphi and Andy Eddy, well-known video-gaming journalist and net.lurker. B-)

I've cleaned up the stuff to make it a little more presentable, but I have not altered anything vital. Andy and Chris' exchange is below; comments in [square braces] are from yours truly.

''''''

> A programmable Object Processor that can act as a variety of different video architectures, such as an advanced sprite engine, pixel-mapped based systems, character-mapped based systems, and many others.

> 27 MIPs DSP [Digital Signal Processor] with 8K bytes of zero wait-state internal SRAM for CD-quality sound and full stereo capabilities.

> A blitter that can perform a full range of logical operations at high speed, with hardware support for Z-buffering and Goudraud shading.

> MC68000 CPU clocked at 13.3MHz as a general purpose control processor.

[Five processors do not equal five chips; see below]

* Lifelike quality 32-bit color on NTSC or PAL television screens, yielding greater than 16 million colors (16,777,216 exactly).

* Screen resolution of 720 x 576.

* ROM cartridge capacity to 48 megabits [6 megabytes] of compressed or uncompressed code. When compressed, equivalent to almost 400 megabits. [50 megabytes?!?]

* 16 megabits [2 megabytes] of fast page-mode DRAM.

* An optional double speed CD-ROM drive. ($200, sometime during 1994)

* ComLynx I/O for networked multiconsole games (even with Lynx and Jaguar mixture).

[I smell a Lynx adaptor for the Jaguar in here. And the idea of chaining Jaguars and Lynxes is tantalizing]

* Two (expandable to literally dozens) enhanced controller ports, supporting digital and analog interfaces, as well as keyboards, light guns and mice.

[Expansion probably by a multiple-port tap, naturally]

* High performance, ergonomically designed, controller with joypad, three fire buttons, Pause, Option, and 12-key keypad with game-specific overlays. ["Ergonomically designed"? Definitely press release hype]

* High speed synchronous serial port for connection to modems, cable TV, networks and other high performance networks.

[No word of the rumored built-in modem. Darn]

There are two custom chips, code-named Tom and Jerry, which combined contain four processors. Jerry has the DSP, the 8K SRAM, a sound block and a block for "timers, UART, joysticks and clock control." Tom has the "DRAM memory controller, object processor, GPU (w/ 4K SRAM) and the blitter." The 68000 is separate as it has the DRAM and cartridge/CD-ROM ties.

No discussion of licensees signed or interested. Formal announcement(s) will take place in mid-September.

<<Chris>>
What games did you see?

<<Andy>>
The games are much like the 3DO stuff that has been shown.

CYBERMORPH is a side-scrolling shoooter, and there was a way to move ahead in the game with a button push (I suspect as a demo), and it screamed the data past the screen F-A-S-T. CYBERMORPH has been renamed to something like "Trevor McFur in Crescent Galaxy" [Uh-huh...]

There was also on-the-fly rendering, much like STARFOX, but without the ship "on rails", in the words of [Atari Technical Spokesperson] John Skrutch. You can go anywhere. [Is this CYBERMORPH, or some other game? CM is a side-scrolling shooter, but "going anywhere" requires a first-person perspective...]

Also, a scene from ALIEN VS. PREDATOR.

I missed all but the last two questions in the presentation, so I'm going to try to get a copy of the videotape they made of the event.

<<Chris>>
Would you say the 3DO stuff you have seen surpasses what you have seen thus far for the Jaguar?

<<Andy>>
I'd say it's comparable. That's an important note, given that the Jaguar is one third the price, or about half if you add the CD-ROM drive.

[Maybe not that low. A $199 Jaguar and a $200 CD-ROM drive totals $400. And now there are rumors that the 3DO unit from Panasonic may sell for $499. But then, you don't _need_ to get a CD-ROM with the Jaguar...]

<<Chris>>
Can you describe the physical Jaguar unit?

<<Andy>>
Sleek, black, kinda like a Merlin: Rounded corners on a square unit. Like someone said, though, when the CD is on top, it looks like a toilet... (especially when the CD cover is popped up). [This implies, of course, that Atari was showing either a CD-ROM prototype of some kind with the Jaguar, or an illustration of the same]

Also, Atari is dropping the "only Ataris" policy for development and such. [YAY!] Because of that, there is an [Atari] TT development station and a PC station, but tools are being used on Macs and others. They are still talking about using high-end computer rendering software that already exists (like SoftImage, which was used on commercials and on Sega's Virtua Racing).

<<Chris>>
Can you desribe the scene from ALIENS VS. PREDATOR you saw?

<<Andy>>
It was just a representation of what the halls would look like while you moved

through them. Very cursory. I was going to sign an NDA to see more of the stuff upstairs, but they didn't have one handy (the guy was out to lunch) and I wouldn't be able to talk about them anyway (hehe).

Also, I'm trying to get disk files of pictures, which Bob [Brodie] is working on. Oh, and there will be a detailed conference with Bob and Sam [Tramiel] next Wednesday, in the World of Video Games SIG, right here on Delphi!

They handed out great T-shirts. (hehe)

nor would anyone buy it. who wants a console that costs $4000 ? Your
point is a good one. The thing to do is beat the current technology by
one step. To a gamehead, that means 8 bit (NES) 16 bit (SNES, Genesis)
to 32 bit (CD32).

IMO, a sound idea for commodore. Now, let's see if they can make it
sell. If it does, then maybe they'll have the R & D to put out the
RISC based series.....

Let me comment on this, in passing.

While it is true that CD32 selling well would be a HUGE shot in the arm for C=, it is NOT necessarily true that a low selling CD32 would be C='s death.

The current crop of products are poised to sell very well. C= screwed themselves last Christmas by confusing the market; they released their AGA systems, which killed sales of their old systems, yet their AGA systems were relatively unavailable.

As a result, sales were not what they could have been.

If they're careful, and don't let that happen again, the A1200 is poised for a very good christmas. It alone could be enough to save C= for at least another year, and depending on how things go, could be enough to pull them out of the dive they've been in.

Just my opinion; but the demise of CD32 does not equate to the demise of C=.

Greg

Re: Falcon 030 street prices

I did not take that good a look. AS I said, the 1/0 config is about $799. The 4/80 is about $1299. I am not sure about the other configs.

So according to these prices, the extra 3 MB and 80 MB drive cost about $500. That is not horrible. To upgrade, you would need 4 1 MB simms, and an 80 MB drive. The SIMS are worth about $30 (going for $55 now, but they will fall again, they are artifically high now). Anyhow, even at $40 each, that is $160 for the 4MB of memory. That means that the HD should be worth about $340.

Normally, I would say an 80 MB HD is worth about $160. It is, however, a 2.5" drive. (IDE I think). So that is not too horrible. I am sure you would be better to buy a 1/0 no matter what your needs, and then expand to a 1,4,14/0,80,XXX depending on your needs. But it looks like hte prices with more memory and HD are not too bad (and you dont have to invalidate your warranty).

2^32 is nowhere near 510MB! Try 4096MB! (4 gigs).

And if you had that much money, you could make the 030 address it. I am sure that the atari uses 24 of the address lines, as there would be no good reason to use the rest.

However, dont be fooled into thinking that if there is a 32 bit bus, you can expand to 4 gig. For one thing, the SIM slots will probably only take 4 MB simms. As you probably know, the old SIM slots only take as large as 4 MB simms. The newer 72 pin slots will deffinately take 1, 2, 4, 8, 16. They presumeable will take up to somewhere areound 256MB simms. But, the Falcon probably uses the normal sim slots (max 4 MB each)

Don't forget about the ~$150.00 - $200.00 worth of software that comes with the hard drive model. This would bring the numbers into your normal range for the hard drive itself. In case you didn't know, the software included is Atari Works, SpeedoGDOS, MultiTOS, System Audio Manager, Direct to Disk recording software, a calculator program, a calander/appointment program, a couple of simple games, Audio Fun Machine, and maybe something else minor I can't think of right now. Come to think of it, all this is pretty decent stuff and may be worth more than $200.00. Then again, some of this may come with the non-HD model, but not all of it (can't remember what only comes with HD, but I know there is a difference).

Because there's a potential market out there Marc. I guess my concern
is the Jaguar.

I wouldn't say the CD-32 is going to be cutting edge technology by the time
Christmas rolls around. CD-32 is *slightly* ahead of the Sega Genesis and
SNES consoles in technology. The Jaguar and 3DO are waaaaaaaaaaay ahead.

Also, I can understand calling the Jaguar vapor as it is an Atari product. :)
But surely the 3DO Consortium (which includes giants like Panasonic and Sanyo)
aren't going to blow Christmas (or much vapor). When I go to stores like
Babbage's Software and talk to the sales people, I hear them talking about how
they are going to be promoting this "vapor" 3DO in the front of all the stores
in the chain.

I don't see any large retail chain offer such exposure to Commodore. (or for
that matter, Atari!)

The Jaguar has a better chance than the CD-32 of surviving because it has been
consistently getting better media. Commodore's only chance of stealing some
of the Jaguar's and 3DO's thunder is to mount an aggressive advertising
campaign for their system.

So what is the Video Toaster Screamer? :) An Amiga with 4 RISC processors.
Does that make it an Atari Falcon then? hehehehehehh

Well, remember, the Falcon won't take SIMMS without an expansion board.
The board costs $99. Why Atari didn't make it take SIMMS to begin with is
beyond me...

I have to add that I've seen some places advertising memory as low as $28 for
1MB x 9 SIMMS. This epoxy/resin scare seems to be affecting some but not
all of the memory merchants... does anyone have any idea why?

Commodore didn't conjure up the name "Amiga". They liked the computer so
much, they bought the entire company - Amiga, Inc.

I'm sorry, but I just need to say that this guy (or is it an insult to guys?)
makes me laugh. So don't flame me for answering him, OK? I mean, how much
flowed logic can you put in one message? I'll just clear what he said:

The Amiga has everything in common with the C64 now. I can't even think what's
bad with that. I hope this is true. The C64 was much more successful than the
PC as a home computer at the time. Can't think what Marc's point was, so I'll
go on.
High-end Amigas are so uncompetitive in the multimedia market, that no one
in their right mind would use them for producing television programs, let
alone put them as information systems in airports.
In fact, the Amiga is now worse than the C64 (at the time, I assume). It's
really bad compared to the games machines out there, now that games machines
are selling like hot cakes (or PCs...). And it should really be compared to
the C64, which was a very good machine for games, and could have really
created the consoles market.

Hope everything is clear now. Anyway, I really like this Marc guy. This
group just wouldn't be the same without him.

Exactly. It doesn't seem to hurt Sega or Nintendo. C=s job is
not to keep the Amiga confined to some geekboy hacker twit vision
of a real computer, but to make money. If making the Amiga system
via the CD32 incarnation a game machine is what is required to do this
then sobeit.

>We all know that Amiga has been known for its game image, but it isn't

Why? They don't have anything else to promote. The Amiga as a serious business
computer? Can it talk to my SQL database server? Can I run my FoxPro
and Access databases on it? Will it's software read Word and WP files?
I didn't think so.

All the Amiga has left is DT-Video and Games.

>I didn't think so.

Hmm...let's assume a fast 486 with DOS/Windows connected to an IP based
network and running some Windows' version of X. Now here you are running X
off your "server" so to speak and you decide to start tex and using it (say
Scientific Word for Windows-> no relationship to Word). What happens? You
have to decide which is going to give. In other words, networking using
Windows where I work, and running the programs I need, can't work with
Microsoft's DOS/Windows. It can with OS/2, but that's another story, and
it can with the Amiga ( heck even my CDTV can do it better than my 486) and
it can't with the Mac.

Your view of the world is somewhat slanted. Accessing an SQL database or
running Word/WP is not all there is to science/computing/ etc...In fact
that kind of stuff is perhaps 20 years old or more.

The PC with DOS/Windows is not a serious machine where I work. The only reason
it even exists at this point is cost. Microsoft (and IBM to a degree) has
set back computing years. IBM is trying to make amends. Microsoft is
continuing with NT...What else can one say? Your arguments against the Amiga
are valid in some sense, but very similar ones can be made against most
platforms.

For once I wish someone would put both Word and WP in the place they belong.
They have managed to make placing words on paper an industry with updates
every other day. Neither is particularly good at scientific typing. For day
to day things Final Copy II serves me just fine. Otherwise it's LaTeX.

I think they'd be better off keeping it as a 'games computer'
rather than a 'games *machine*'. A large part of their installed base
actually load programs, use compilers/assemblers, and upload and download
software. Taking that away and leaving just a games console with
non-competititve features is stupid (unless they sell it for about $50, and
then probably not. I mean, you can get a C-64 with games for $50, but who
wants to?). The specs for the hardware in the 3DO and Jaguar make AGA
look sick and puny, and the Jag is supposedly going to sell for ~$200.
CD32 is supposed to compete with THAT?

Atari says it's planning to sell 500.000 Jaguars wordwide. Judging by the
local reactions here, they could succeed. That would mean a few hundred
million dollars worth of equipment to be sold, including games etc.!!!
Atari would once again be a mayor player in the industry. This could
also mean a LOT for all Lynx and especially Falcon owners, regarding
support, advertising budget etc. Any comment on this thought?

500,000 is still a very conservative number.

For example, Sega sells well over 7 million Genesis units worldwide each
year. Nintendo sells just as many of the SNES if not more.

I would say that 1 million Jaguar units seems like a better number for
1994. Perhaps 4 million Jaguar units for 1995. And 6 million units for 1996.

Remember, Nintendo sells 4 million GameBoys each year. I don't believe
they sold that many last year, but they have sold that many ever since the year
after they released it. This was in the U.S. alone!

BUT, 50,000 for this year seems about right for a company that doesn't seem
to have too much money. Too bad Jack Tramiel can't loan the company
some money from his own personal bank account.

Have a look to comp.sys.sgi.announce. There is a article today about
a new gamesystem developed by a join force of SGI (sigh!) and Nintendo
They want to use the SGI-Technology for a 64-Bit Videogame with a price
of 250 Dollars.

That's what Atari is going to do too .... they haven't got enough money to push the Falcon only, or to develope new 060 machines ( :-) ) .. but with the help of 500.000 sold Jaguar systems, they won't have to worry about money!

Imagine a *FAST* 060 based Falcon, with dual 96002 and such, which Atari doesn't need to get a good profit on .... ouch .. :-)

Oh, I heard that Raiden is coming for the Falcon .. that's a result from the Jaguar development ..

|> BobR

Well at least he uses his computer for something other than a dumb terminal. Among the computer owners I know most are now have 80386DX-40s or 80486SX-33s. All have a boot-leg copy of WinDOZE, and Dashboard (nice program btw), most have gotten boot-leg copies of Micro-sloths Office and all they do is play games and call bulletin boards.

So what Bob what do you do with your computer? And to answer the question before you ask, I'm working on a CD-Rom driver for MiNT, I have written a WAVe player for the STe/TT/Falcons, and generally experiment with 3-D graphics. And yes I have an account on GEnie, and Compuserve.

We can only hope that the power's that be (Atari management) will be able to take advantage of any name recognition generated by Jaguar sales. If it (the Jag) turns out to be as popular as expected, I think Atari could reasonably expect to see some increased sales in other lines.

Bigger sales for Atari would mean a larger installed base of machines and that might attract some of the big software houses back to support that base. Of course knowing the way Atari handles its affairs, the Jag will sale well for a couple months. Atari will discontinue advertizing it and give up another market to the Johnny-come-lately competion (eg. the Portfolio.)

# 1219. Yet another Jaguar comment, and another ad idea (just for fun :-)

Newsgroup: comp.sys.atari.advocacy
Date: 1993-08-26 22:40:41 UTC
From: rcarter@nyx.cs.du.edu
Message-ID: <1993Aug26.224041.16623@mnemosyne.cs.du.edu>
Source record: 22055

I think Nintendo got caught as flat-footed this time around by the Atari Jaguar, as Atari got caught by Nintendo, last time around...

The Nintendo/SGI machine is too little too late, when compared to the Jaguar...

Oh yeah, the ad idea; this is a print ad... A $10 off coupon, with a hologram of a Jaguar on it along with:

Header... To the parents of (fill in country of ad)...

Body... Find below the only gift that will come in an envelope that yours kids will like this X-Mas...

Tag... Coupon good for one Atari Jaguar Game machine from (fill in the blank, Mom and Dad...)

Along the bottom of the ad...

ATARI ----- JAGUAR ----- TOMORROW ----- TODAY

Atari needs to get print ads like this in a large number of publications the six or so weeks leading to X-Mas, as the intro (bad mistake!) won't be until after the holidays...

Give the parents something to give to the kids at X-Mas; allow them to pre-order somehow; let parents call Atari with their credit card orders in those 6 weeks before X-Mas, with a coupon sent to the kid from Atari, good for redemption at any store that carries the Jaguar...

Sure, it will cost a few extra bucks to something like this, but it is imperative that Atari get those machines into the homes -this- X-Mas, even if it is in (pre-payed) coupon form...

Just some thoughts from the keyboard of...

I am an atarier from the first day, i own a 8,16,32 bit atari. But I am one
of the few i hate to admit. Atari isn't the biggest selling computer creator.
In fact I think that they are the last "little" computer designers. (like
ZX sinclair Spectrum that is). Atari sold everything that made the parts of
their computer, the only way for them to make money is by management profit.

It's only a matter of time, until they faint away. Unless the Jaguar is going
to sell like hell. But let's face it; Management of atari sucks.

Probable "The Jag" will never have the same brand faim as something like
Nintendo or Sega. Let's face it, if you ask someone on the street now, if
they would like to buy a jaguar. They would say they can't afford it (and
they mean the car). If you explain to them that it is a console they say,
that they have bought a nintendo or sega (or even a lynx) allready.

Reality hurts. It really does.

Perhaps I will buy a jaguar. (Just because i hate the majority.)

Well, the Jag has gotten some decent coverage in the video game rags, even
as just a vapor box. Even 3DO has been getting a lot of mention in the
media over here, and Sega and Nintendo are both spewing stuff about
making 32 and 64-bit systems, etc. etc. to try to deal with the fact
that a consumer 64-bit system is coming.

So I think while it isn't a household name, it is generating some excitement
already... (and the magazines were using info from 1-2 months ago!)

I have played the Jaguar. They had a functioning (without sound)
Jaguar within three weeks of announcing it.

For Atari, vapourware does not mean that they don't make the product.
You just never see it, or it takes a few extra years.

Anyhow, I only played one game, Cybermorph. I saw a demo of 5
others.

My, oh, my ... touched a nerve, eh?

In article <88834@cup.portal.com> Bob_BobR_Retelle@cup.portal.com writes:
>'Scuse me George... come back down to the real world...

Real world approaching! :-)

>A'486 system can be had for a LOT less than a Falcon, and with a lot
>more USABLE features.
>

Well, sure, you can get a '486 for less than a Falcon. You can get a
Timex Sinclair 1000 for less than a Falcon, too, at a garage sale.

Remember: the Atari computer can run the *same* benchmark (256-color
Mandelbrot set) faster than a '486 running at 66 MHz. The numbers
reported from CeBIT were: '486 -- 6 seconds. Atari -- 4 seconds.

BTW -- Another poster complained that these numbers weren't "fair" because
it was using the "stock" Atari hardware to achieve this performance.
I'm not too sure where the unfairness is in the comparison. Was it
just an oblique reference to the fact that even the Disc Operating
System (DOS) is not standard equipment on an MS-DOS machine? :-)

>Not to mention that an equivalent '486 system can actually be FOUND at
>a zillion times more dealers, and software is actually *available*...
>

True (for now): the '486 system can actually be FOUND at a zillion more
dealers. And for equivalent performance, you need to spend $2500 or
more. That's certainly excessive compared to the Falcon's $1500. When
comparison shopping, I'd certainly go out of my way to save $1000!

True (for now): software is actually *available* for a '486 machine.
Would you seriously consider running it on a '286? Probably not.
(I've tried running Excel under Windows on a '286, in which moving
from one cell to an adjacent cell ... just a move ... took 3 seconds.)

True (for now): software is actually available for the Falcon.
Would I seriously consider running it on an ST? Probably.

>Do YOU do "direct to disk" recording..? If you do, you're in a tiny, tiny
>minority of computer users... why not pay for a bigger hard drive, or
>a better resolution monitor instead of features you'll never use..?
>
>BobR

Because Atari programs are more compact then their MS-DOS equivalent,
an 80 Megabyte hard drive gives space equivalent to 240 Megabytes on
a clone. GEM doesn't require 4 Megabytes of RAM and 20 to 30 Megabytes
of disc space to operate. Microsoft Windows does require all of this.

No, I don't do "direct to disc" recording. However, I do use my machine
for tracking the stock market (STalk The Market), desktop publishing
(Calamus), modem communications (Flash), spreadsheeting of payments
received (Logisitix), occasional letters to friends (ST Writer),
various utilities (ICD hard disc support, TOS patches distributed freely
by Atari), and an accessory (Card File 4).

What do you use yours for?

DOS does NOT stand for Disk Operating System... Not if we're talking about MS-DOS, anyway. MS-DOS is derived from QDOS, and EVERYBODY (sheesh ;) knows that QDOS stands for Quick and Dirty Operating System. So MS-DOS must stand for MicroSoft Dirty Operating System. See? ;)

That's nice. It beat the 486 on one benchmark (and such a popular one, too!). It must be faster in general, by induction. 50% faster, too, I suppose. How scientific.
I would like to see anyone cite benchmarks in which a 486/66 (or for that matter any 486DX) running a 32-bit operating system was outperformed by an Atari computer. Good luck.

>BTW -- Another poster complained that these numbers weren't "fair" because

What the hell is an "MS-DOS machine"? They're called PC's. They are Intel 80x86-based personal computers. They run MS-DOS and Windows, and WindowsNT, and NeXTStep, and OS/2, and Solaris and countless other versions of UNIX...

>True (for now): software is actually *available* for a '486 machine.
>Would you seriously consider running it on a '286? Probably not.
>True (for now): software is actually available for the Falcon.

What software? Which of the best cross-platform (Mac and PC) software packages (Photoshop, Illustrator, Excel, etc.) are available for Atari? I can't believe you would even compare the application base for these two platforms. What a joke.

>Would I seriously consider running it on an ST? Probably.

Is this relevant? I don't think so. ("My computer is better than yours because the software it runs runs better on old computers than your software runs on old computers!")

Yeah, I disagree with that original poster's idea that the Falcon can outrun
a 486/66. I think that for specific purposes, hey, sometimes the DSP will
do something that will yield 486/66-like results... but in everyday use,
the machine probably won't come close in raw computational power.

>I would like to see anyone cite benchmarks in which a 486/66 (or for
>that matter any 486DX) running a 32-bit operating system was
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
What 32-bit OS? The only ones I can think of for Intel boxes are
NeXTStep, OS/2 2.1, and the various flavors of UNIX. However, I think
everyone has to agree that when a typical person buys one of these
price-competitive $1500 486 boxes, they aren't getting those OSes. They
are getting DOS 6 and Windows 3.1.

>outperformed by an Atari computer. Good luck.

And the system requirements to run NeXTStep for Intel require that you spend roughly $3000 on the machine.

(the OS alone, unless you get an educational discount or get the trial package which offers no upgrades is $3000, but if you go edu-discount, a very reasonable $250... it does come on CD-ROM, though.)

WindowsNT... is that shipping now for the PC?

Solaris is nice, as is Linux, but let's face reality... the stock PC user boots into DOS and loads up Windows 3.1. The beauty of their platform is that they have the option (unlike ST/TT/Falcon owners) to get a real Unix on their box. (Some may argue Minix/ST is close enough... perhaps it is...)

You have a point there. The PC has huge amounts of software.

>Yeah, right.

Actually, I'd have to agree with that. However, I think those massive DOS and Windows apps are also offering more features... and higher price (in general). But not many ST programs require, say, 5 or 6MB of HD space.

Alternately, the only less-than-32-bit operating system I can think of
is MS-DOS (Windows3.x being an environment). As for pricing, OS/2
sells for the same price as Windows, and "competitive upgrades" from
DOS/Windows to OS/2 are probably about $50 from IBM. So the price
really isn't an issue. (Not to mention Linux, which is _free_). So
those $1500 may _come_ with DOS/Windows3.1 (unless you specify
otherwise), but you can easily get a 32-bit OS on the same PC for
$15xx.

>And the system requirements to run NeXTStep for Intel require that you

I believe NeXTStep lists for $795. You may be thinking of the full
developer's version.

>WindowsNT... is that shipping now for the PC?

Sure is. $295 retail, $110 edu-discount (here, at least). I think the
MIPS release version is shipping now too, incidentally (not Alpha
yet, though). NT started shipping about 3 weeks ago, I believe.

You're right. The student version is a full developer's version for $295.
If you run NeXTstep, its probably a lot nicer to have the developer's

version because you get the full suite of development tools and I think they also throw in an Encyclopedia or somesuch option, right? :)

Hmmm. Well, I'll eat my words on NT then. :) What does NT offer over 3.1 other than being a "full 32-bit environment"? Is it essentially a clone of say, OS/2 2.1 in regards to the functionality it offers compared to DOS/Win3?

You need to go back and look at the press release a little closer -
this system has a tenative release date of LATE 1995!! That is about
2 years from now... I really think Nintendo thought that they would
be the leader for some time with the SNES, and were unprepared for 3DO
and the Jaguar. This leaves only Sega a possible contender at this
point... We have yet to see what they have planned, and they must
have been working on something after all this time.

Interesting idea. Could the Jaguar be made to emulate the Segas and Nintendos
of the world and nick their customers looking for the support of the S&N, but
the features of the Jag?

>1. It has a 68000, eh? Isn't that, like, kinda crippling?

Nope... really... all this chip does is apparently handle some of the work
being done in the system. The major work is done by 64-bit RISC chips and
DSPs on a 64-bit bus.

And the 68000 in Jag runs 13.3mhz. That's almost 2X faster than a stock
A500/600 machine. :) Crippled? :)

>2. Why should it be better for Starglider-type games? (No, I didn't mean

>Does it have some special 3-D or texture-mapping chips or whatever? And if
>so, will they be enough to overwhelm the CD32's '020+Akiko combination?

Yes, they have 3-D, texture mapping built-in to the custom chipset.

Can it beat the '020-Akiko combination?

Well..... i don't know anything about the CD^32's chipset, but the Jag's
specs sound amazing. Read the press-releases on atari.archive in the
/Newitems directory and get the full scoop on the specs.

>3. How many people are going to own so many Jaguars that they can network
>them (or did you mean, network them over phone lines -- which would be kind

>of a nice feature.)

No idea. Another thing they have mentioned is that some Jag games will link up to the Lynx via Comlynx making for some..... interesting possibilities.

(3 or 4 friends drop by and play along with you on the Jag... no need for split screens... but you might need a surge supressor for all those wall warts...)

>4. How do the rez/colors compare with AGA? Which also provides 24-bit color

Jag does 24-bit color in 720x576.

>5. Who's promising to write games for this monster?

No official word yet on 3rd parties. Could be absolutely no one. :)

>6. When's the release date?

Late this year in NY and SF, worldwide early '94.

>7. Will it be advertised? (Not that that helped CD-I...)

$3 million before this Xmas and $45 million next year.

>8. Why is everyone so excited about it anyway?
>
It's $200.
It's got 24-bit video.
It's got a 32-bit expansion slot.
It's got a set of 64-bit custom chips on a 64-bit bus.
The games will run $50-$80 (just like SNES and Sega).
It's got 15-button controllers!

What is there NOT to get excited about?

Make that chip, AFAIK the only 64-bit chip in the system is the blitter
AKA 64-bit RISC chip.

> And the 68000 in Jag runs 13.3mhz. That's almost 2X faster than a stock
> A500/600 machine. :) Crippled? :)

No, but I would call them old technology. ;)

> Yes, they have 3-D, texture mapping built-in to the custom chipset.

Impressive, if it only take a few register changes to produce these
effects.

> Well..... i don't know anything about the CD^32's chipset, but the Jag's
> specs sound amazing. Read the press-releases on atari.archive in the

Yep, I remember reading the Falcon specs when they first came out, it
-sounded- impressive too. Did it live up to expectations?

> No official word yet on 3rd parties. Could be absolutely no one. :)

Well there are apparently 25 Jaguars in the UK now, each with a
development team. BUT and it's a big BUT, there were several developers
who refused to sign the Atari NDA, the likes of Electronic Arts, Gametek
and Psygnosis were among them.

> $3 million before this Xmas and $45 million next year.

That's funny Atari said that they have $40 million left for the launch
of the Jaguar. 3 + 45 != 40 :)

> It's $200.

Without a CD

> It's got 24-bit video.

Gonna need BIG carts for all those 24-bit graphics...

> It's got a 32-bit expansion slot.

Don't think it is as 'open' as the CD32 slot.

> It's got a set of 64-bit custom chips on a 64-bit bus.
^^^^^
It has a 64-bit blitter on a 64-bit bus. :)

> It's got 15-button controllers!

The joypads are supposed to be 10 button, originally created for the
Falcon.

> What is there NOT to get excited about?

errr.... The Jaguar.... :)

Martin &

|> Great analogy! So very relevant.

Well since you can get 486 machines at garage sales, I saw one two weekends ago, it is relevant.

|>
|> >Remember: the Atari computer can run the *same* benchmark (256-color

Well be carefull on that one here at work a number of the OS/2 boys are grumbling about my TT running faster that their 486, I'll admit their machines do not have localbus video :)

|>
|> >BTW -- Another poster complained that these numbers weren't "fair" because

|> Intel 80x86-based personal computers. They run MS-DOS and Windows,
|> and WindowsNT, and NeXTStep, and OS/2, and Solaris and countless other
|> versions of UNIX...

PC = Personal Computer, or Professional Computer. And Atari computers fits both these descriptions just fine. Only the hubris of the MS-DOS/IBM-PC clone owners cause them to believe that their choice of processor is the only real PC. If you want a flame war go to comp.sys.amiga.advocacy and say that no Amiga is a PC because it does not run MS-DOS and Windows, WindowsNT, and NeXTStep, and OS/2 :)

btw: can a MAC be considered a PC? (by your defintion NO)

|>
|> >True (for now): software is actually *available* for a '486 machine.

|> packages (Photoshop, Illustrator, Excel, etc.) are available for Atari?
|> I can't believe you would even compare the application base for these
|> two platforms. What a joke.

Well let's see are we interested in Excel spreadsheets, MS-Word RTF files,
AutoCad files, Word Perfect files (even 5.0), all theses can be used on
Atari computers. Or is just that Micro-Sloth is not supporting Atari computers
that causes you grief?

|>
|> >Would I seriously consider running it on an ST? Probably.
|>
|> Is this relevant? I don't think so. ("My computer is better than
|> yours because the software it runs runs better on old computers than
|> your software runs on old computers!")

Sure it is. If I go out and get a new Atari computer the old one is still
a viable machine. Meaning that it will the same software as the new machine,
Now lets see a 8086/80286 run Windoze NT :)

|>
|> >Because Atari programs are more compact then their MS-DOS equivalent,
|> >an 80 Megabyte hard drive gives space equivalent to 240 Megabytes on
|> >a clone.
|>
|> Yeah, right.

Well, actually he is right. Typically 30->40 percent less because of the
lower overhead of having the run time libraries in ROM.

Let's not forget the good old OS:

120k = Multi-tasking extensions (Do not have to have)
410k = Fancy desktop (with trashcan built in, again optional I can use the
built-in desktop though it's not as fancy)
====
530k = A more flexible system than Windows 3.1 or NT

Now a quick check of RAM available (with optional software loaded):

1.3 meg out of 2.5 meg - ST
8.5 meg out of 10.0 meg - TT

You may notice a memory descrepancy, that's because Ataris have always had
the equivalent of local bus video :)

Now the beta version of Windows NT I have here at work requires 12 meg of memory to run and the performance on my 16 meg 386-33 is sluggish. The previous version required 16 meg and I could not run any programs because I did not have enough memory! The fact that NT has eaten up about 40 meg of my 120 megs of hard drive space is just another really annoying "feature". My company is getting me a 100 meg hard drive just to act as a swap disk!

But just think soon you'll have most of the features on your clone that I've enjoyed your years on my Atari. That is of course if you decide to purchase Windows NT. You will PURCHASE it right? No MS-DOS machine owner would ever steal software would they? (Yeah right)

```

|> |<. <_/ohnson --Fish Tales East Lansing, Michigan
```

Please come down out of your cloud and lose your 80x86 bigotry. There is plenty of room for many types PCs. The fact that my choice differs from yours only points out that different people have different needs. Besides going with the rest of the herd has never really thrilled me.

Brian

> Well, sure, you can get a '486 for less than a Falcon. You can get a
> Timex Sinclair 1000 for less than a Falcon, too, at a garage sale.

But you might actually be able to find the Timex Sinclair. Oops, yes,
I've _seen_ one, I've never seen a Falcon. A mere ~200-300,000 people
in this 'small town', with no Atari dealers.

> Remember: the Atari computer can run the *same* benchmark (256-color
> Mandelbrot set) faster than a '486 running at 66 MHz. The numbers
> reported from CeBIT were: '486 -- 6 seconds. Atari -- 4 seconds.

That zippy Mandlebrot demo sure helps me do my work faster (ray tracing,
compiling, DTP, etc)... And it's one of TWO pieces of DSP software that
I've heard of since the Falcon's 'release'... The other is the DSP JPEG
software that people are licensing from BrainStorm.

> BTW -- Another poster complained that these numbers weren't "fair" because
> it was using the "stock" Atari hardware to achieve this performance.
> I'm not too sure where the unfairness is in the comparison. Was it
> just an oblique reference to the fact that even the Disc Operating

Who uses DOS?

> True (for now): the '486 system can actually be FOUND at a zillion more
> dealers. And for equivalent performance, you need to spend $2500 or
> more. That's certainly excessive compared to the Falcon's $1500. When
> comparison shopping, I'd certainly go out of my way to save $1000!

Good luck doing a ray-trace on a Falcon is < 1 minute for 320x200x24-bit
colour. And don't try saying, "Yah, but re-write it to use the DSP and
it'll rip!" Sure it would, but I'm not going to re-work several
thousand lines of someone elses code just to get more performance; it's
easier to just spend the same amount on money on a faster CPU (not that
I would; I'd rather have 12M of RAM and a decent display, like
800x600x16-bit).

> True (for now): software is actually *available* for a '486 machine.
> Would you seriously consider running it on a '286? Probably not.
> (I've tried running Excel under Windows on a '286, in which moving
> from one cell to an adjacent cell ... just a move ... took 3 seconds.)

Software will never be available for the Falcon. It's been out for
what, a _year_? There are very few applications that use the DSP, and
there have been no more Falcon machines announced. I really don't care

if Atari is concentrating on the Jaguar (hey, haven't they heard of multitasking?!?), but I don't want a console, I want a fast, friendly '040-based computer (with a decent case and a good keyboard; don't underestimate ergonomics!).

> True (for now): software is actually available for the Falcon.
> Would I seriously consider running it on an ST? Probably.

Well, since the Falcon is, at most, 4x the speed of the ST, or the _same_ speed as the ST (if you're running in high-res graphics modes; pathetic!), there's no big deal. And besides, almost nothing but demos actually uses the DSP.

> Because Atari programs are more compact then their MS-DOS equivalent,

You really are dreaming. A good word processor, with lots of functions, takes up lots of space on any platform. Granted, nothing takes up as much space as Micro$oft apps...

> No, I don't do "direct to disc" recording. However, I do use my machine

> received (Logisitix), occasional letters to friends (ST Writer),
> various utilities (ICD hard disc support, TOS patches distributed freely
> by Atari), and an accessory (Card File 4).
>
> What do you use yours for?

Don't you think your computer uses would benefit GREATLY from a multitasking OS? Not Windoze, something that really multitasks, like OS/2?

Obviously, you can say, "My computer does all I want it to!" and I'll say, "Yah, eventually." I guess you don't care that Calamus isn't running terribly fast, or that your spreadsheets take a long time to calculate. Me, I don't like to wait for my computer.

I do a lot of compiling, ray-tracing, and DTP; mostly compiling though. It takes the ST an absurdly long time to build programs (gee, only 12 HOURS for NetHack 3.1.3! It takes a '486/33 with 8M of RAM [about the same price as a Falcon030...] an _hour_ to do it.) and there's no way I want to do ray-tracing unless I can leave the machine on all week. The Amiga A4000 actually has an '040 in it, and nice graphics; pity Atari's never going to release another computer (after all, they're concentrating on the Jaguar now).

> P.S.: In your followup (if any), please delete comp.sys.atari.st from

True. But one thing 'FLIP'- The Jaguar *IS NOT* '64-bit RISC based' as
the ATARI specs suggest. It USES 64-bit RISC technology, but the
CPU is a 68000.

OK, thanks to all who assaulted me repeatedly with Jaguar specs. It
does sound nice, actually, but given that this is Atari we're talking
about I'll wait and see. (Not that I'm likely to buy any game console
in the near _or_ far future -- I'm just interested, that's all.)

But... it still seems that CD32 has a huge advantage as far as software
support goes. A Commodore machine being supported _better_ than something
else? You don't hear _that_ every day! :)

Perhaps for the same reason TurboTechnologies used an 8-bit CPU to drive
16-bit graphics and sound engines and called their machine the TurboGrafx-16.

For the same reason SNES has (from what I've heard) a modified chip from the
6502 line in their machine, but calls their box 16-bit.

For the same reason when you read video game rags, everyone talks about
"megs" but don't tell you it is "bits" not "bytes" they are measuring.

:)

They did not. People are doing selective reading, Atari never claimed there
was not a 32/16 bit processor they claimed a 64 bit graphics processor.

Open your eyes, and mind and read the WHOLE THING.

Brian

Sure, fine, yeah, cool... Except they didn't actually *say* 16/32 anywhere, did they? What happened to the truth, the *whole* truth...? Yeah, sure, pr value blah blah blah. I was just expecting something more than the equivalent of a 500 with a graphics accelerator from this great and mighty CD32basher.

At least the CD32 has a *full* 32-bit CPU.

> Open your eyes, and mind and read the WHOLE THING.

Y'know, the problem with having an open mind is that stuff tends to fall out.

Whether something is true does not indicate whether or not it is relevant (please refer to the definition of "relevant" in your nearest dictionary).

>|> What the hell is an "MS-DOS machine"? They're called PC's. They are
>|> Intel 80x86-based personal computers. They run MS-DOS and Windows,

>AutoCad files, Word Perfect files (even 5.0), all theses can be used on
>Atari computers. Or is just that Micro-Sloth is not supporting Atari computers
>that causes you grief?

So you are saying that if you have a utility to convert one of these application formats to anything an Atari uses, then there is no need for the applications on which they originated? The quality of the application interface, its features, etc. are unimportant as long as something else can read or output in the same format? No thanks. I'll keep my PhotoShop, thank you.

And of course, since one of the three applications I mentioned was a
MicroSoft product, then everything would be fine if MS ported its
applications to Atari. Then it would be a truly great computer. (Of
course since I am apparently advocating "PC clones", MicroSoft must
therefore be my favorite software company)
<sarcasm off>

>Now lets see a 8086/80286 run Windoze NT :)

Sorry, if I get a new computer, I intend it to _replace_ the old one.
The point of purchasing a new system is to run more complex software
at reasonable speed; if your old computer runs new software fine, why
get a new system? It is ridiculous to mention NT. Do you think your
512K Atari ST would run NT if it were ported? The 286 was introduced
in what, 1984 or so? That's 9 years of systems that can run Windows
(far and away the most popular OS for systems that can run it).
By the way, please compare the date at which the 8086 was introduced
to the introduction date of the Atari ST.

>|> >Because Atari programs are more compact then their MS-DOS equivalent,

>|>
>|> Yeah, right.
>
>Well, actually he is right. Typically 30->40 percent less because of the
>lower overhead of having the run time libraries in ROM.

Interesting. 30-40 percent less. So 240 MB x ~65% = 80 MB? Or were
you talking about RAM while he was talking about secondary memory?
(What's your point, then?)

>Please come down out of your cloud and lose your 80x86 bigotry. There is plenty
>of room for many types PCs. The fact that my choice differs from yours only
>points out that different people have different needs. Besides going with the
>rest of the herd has never really thrilled me.

I don't care what kind of computer you use. Just don't make false
claims about its supposed superiority to another computer that you
can't back up.
I certainly do not fit your assumption of "80x86 bigotry". I do not
prefer that platform over Mac, NeXT, or Sun/X/Motif. However, I do
prefer a system that runs the programs I use, and if not, is enough of
an improvement over those systems that do that it doesn't matter. I

don't see that in Atari.

>yet, though). NT started shipping about 3 weeks ago, I believe.

You seem to have missed some of the point of the message you were replying to! I have ran NT on a machine with 16 MB of memory. It was not happy. It really wants about 32MB or better. 32MB of memory costs quit a bit. NextStep also requires a significant amount of memory. The software cost is not the significant part anyhow.

But, back to the original topic. Indeed it is INSANE to think a Falcon could outperform a 486-66 in pure computational power. The 030 is a fair amount better (per MHz) than a 386. A 16 MHz 030 probably gives about the same power as a 40 MHz 386. I believe the slowest 486 is 25MHz. Even a 25MHz 486 should be faster that a 16 MHz 030 (probably by 2 or 3 times).

However, part of the idea of the DSPs is that they can be used to make the machine perform much better than without. DSPs are very inexpensive, so if a DSP can give you a significant power increase it is a good move.

Furthermore, we have to base comparisons on the norm. A PC running DOS/Windows looses quite a bit because of the OS. NT or OS2.1 are fairly good. But Windows 3.1 and DOS is still the norm. What matters on speed is the speed that the user sees. It is a very bad experience to run Windows on a 286 and then try to load an application. It is not very good on a 386-40. Windows runs OK on a 486. This doesnt seem to be going anywhere (I am rambling). My point is that with DOS/Windows, which is what most people use, the PC has a severe performance degradation, which leads to the illusion that the processor is slow. In fact it is the BUS and the OS and other factors relating to stupid decisions by IBM in the 70s! I think that Atari should have used a 33MHz 030 and 32 bit memory. But even with a 16MHz and 16 bit memory, it is not as haddicapped as a PC. When the MIPS PCs (if) become popular, and the PC world goes to NT or OS2 (I dont think Solaris or

NextStep have a chance really), the PC will be able to harness most of the processors power. Until then, it is at a disadvantage.

So back to my original point. a 16MHz 030 processor is about as fast as a 40MHz 386. That is maybe equiv to a 10 MHz 486 (yeah I know they dont exist). So with DSP and the difference is architecture, the Falcon could perhaps do real benchmarks (not the fractal one which is pure DSP and not indicitive of speed in general) about equiv to a 20MHz 486.

This is all, of course, IMHO. (but based on my own observations and knowledge). I use a 386-33, a MAC with a 25MHz 030, and an Atari ST (yeah, 8MHZ 68000). At work I use a 66MHz 486 and a 25MHz 040 MAC. What we really need is some firm benchmarks. I have no doubt that a 66MHz 486 will beat a Falcon, except in very DSP intesive stuff. But the Falcon utilizes it's processors power much better.

Are simple but standard benchmarks available on the Falcon? We should be able to do some Sieves and dhrystones and a few others and at least get an idea. I would like to see this on maybe 5 different breeds of PCs (386s and 486s), a few macs, the Atari Falcon, TT, and original ST. Of course difference is the specific implementation of the benchmark can make a difference, but at least we will have a good indication of performance in general. (On the Falcon, and a new DSP MAC, it would be nice to do the tests both with and without the DSP if possible, although I think that for the tesst designed to be similar to real worls uses, we need to use the DSP, as it is being used for exactly that purpose).

Anyone have said benchmarks? Or maybe source code?

According to the EETimes article last month about the Jaguar, which quoted
Atari people, the Jaguar is powered by a 64-bit RISC processor of
Atari's design. Now I find out that the Jaguar is driven by a 68000.
That doesn't _neccessarily_ make the Jaguar any less exciting, but it
does make me wonder what the next big lie is going to be.

Dan

Eyvind, sorry for the jumping in, but the CD-32 may have a '32-bit' engine,
but the Jaguar has some coprocessors that from what it looks so far, could emulate
CD-32 several times!

An interesting comment, and one which I'm sure you will live to regret.
Think multiprocessing; think CPU, blitter, copper. All of which the Amiga
has had since the only ST was the 520ST.

Well, the data bus, you know, the bit of the CPU that communicates with the actual *memory*, yeah, that's right, the bit where you read your code and data. Why the hell do you think Motorola *makes* true 32-bit CPUs? Why do you think everybody didn't just stick with 8 bits?

> |> Y'know, the problem with having an open mind is that stuff tends to fall out.
>
> Yep I sure hate when that stupidity and arrogance falls out :)

Well, I'm sorry, but I'm having great difficulty in keeping from extreme verbal abuse, possibly because you just now, in that very same post, claimed - no, stated - that a 16-bit bus is equivalent to a 32-bit bus. Forgive me for my stupidity and arrogance in not being able to see this equivalence.

I love this... "The RISC chip in the Jaguar is not a fucking 68000!".
Well, some people might be tempted to reply "Of COURSE it fucking isn't,
DIMWIT! The 68000 ISN'T a RISC CHIP!". But far be it from me to pass
comments such as this. Particularly in such a vulgar manner.

> No better yet, sit at home and make up some more bullshit about it.
> That seems to be what you people are good for!

Look, as far as I know, the CPU in the Jag is a 68000, OK? And no, I
really don't give a shit whether it renders gouraud-shaded napalm
polygons from HELL faster than an Onyx with a RE2; if it has
a 16-bit CPU, it's a 16-bit machine. By definition.

> (BTW this is not aimed at the msg I am replying to, but instead the

>That doesn't _neccessarily_ make the Jaguar any less exciting, but it
>does make me wonder what the next big lie is going to be.
>
>Dan
>
It isn't really a lie; the Jaguar does have a 64 bit RISC processor.
It [the RISC] is not the CPU, which is what people automatically seem to
assume, but is still has a 64 bit RISC processor.

No, that's Atari's job, so they can lace their press releases with
bullshit.

They can probably get away with calling this thing the Falcon II.

Atari did the same thing with the Falcon. "32-bit CPU!!!" Heaven forbid they mention that it's sitting on a 16-bit bus. This time, they didn't bother sticking the faster CPU in, that's all.

You know, they're getting pretty good at misleading the public.

Please "Open your eyes, and mind and read the WHOLE THING."
It seems that because there is a 68000 in a system a couple people
believe that it runs the whole thing. Could it possibly be that the
68000 is just an ancillary processor, not the main processor?

Yes Motorola makes the 68000 familly of processors, all of which are 32-bit processors, though some have 8/24, 16/32, 32/24, and 32/32 external data/address busses.

Sorry but I did not make any such claim. I was taking about the CPU being
a 32-bit processor. With regards to the 16 bit data bus I said "big deal"
which does not translate to "a 16 bit data bus is the same as a 32 bit data bus."

If your going to quote some one please be accurate.

DSP's are inexpensive, but is the supporting hardware (allowing
DMA/shared memory access) equally inexpensive?

> Furthermore, we have to base comparisons on the norm. A PC running
>DOS/Windows looses quite a bit because of the OS. NT or OS2.1 are
>fairly good. But Windows 3.1 and DOS is still the norm. What matters
>on speed is the speed that the user sees. It is a very bad experience

By that argument, PCs and Macs are the norm, so the speed of the Atari
doesn't matter. You can't say the Atari is a better performer than a
486 and then say that the 486 can't use the best OS in the comparison.
People who really care about performance _will_ use the better OS.
The majority of users with a 486 _are_ using DOS/Windows, but then the
majority of users never do anything that requires a fast computer or
more than a 16-bit OS. The people who really need performance _will_
be running OS/2 or NeXTStep or Unix or NT (or, next year, Windows 4.0)
on their 486.

>decisions by IBM in the 70s! I think that Atari should have used a
>33MHz 030 and 32 bit memory. But even with a 16MHz and 16 bit memory,

Why not an 040? 25MHz 68040s have been around since 1989.

>it is not as haddicapped as a PC. When the MIPS PCs (if) become
>popular, and the PC world goes to NT or OS2 (I dont think Solaris or
>NextStep have a chance really), the PC will be able to harness most of
>the processors power. Until then, it is at a disadvantage.

You are apparently saying that those options have to become popular to
exist, which is somewhat backwards logic-wise. Like I said, anyone
who needs all that processing power can easily get it.

> Are simple but standard benchmarks available on the Falcon? We should
>be able to do some Sieves and dhrystones and a few others and at least

>nice to do the tests both with and without the DSP if possible, although

>I think that for the tesst designed to be similar to real worls uses, we
>need to use the DSP, as it is being used for exactly that purpose).

I believe, at least on the Mac, that code has to be written (compiled?) to
specifically make use of the DSP, so it's probably not just a matter of
disabling the DSP.

> Anyone have said benchmarks? Or maybe source code?

Try marlin.nosc.mil, /pub/aburto/*
This site/directory contains source code and tables of results for
many benchmarks. There are plenty of x86 and Mac results already, so
the Atari results are all that would be needed for comparisons.

Unfortunately, unless you are running UNIX on your Atari, the source
might require some modification; the timing routines that they use are
not standard across platforms, and I don't remember seeing any Atari
ifdefs in the code. Then again, when you go messing with the code...

Of course, benchmarks are no comparison to running the same task in
the same application on each platform, but since most of the programs
generally used for that (Excel, PhotoShop, MSWord/WordPerfect, some
popular DB program , etc.) are probably not available for Atari,
that's somewhat difficult.

In fact they'll probably compile straight off if you're using the
MiNT libraries for gcc/Turbo C/Lattice C/whatever. Define the system
as -DUNIX on the command line (for gcc) and it ought to go with no
problems. The libraries are almost identical in their interface to
the libraries on unix hosts. I regularly download and compile source
from comp.sources.unix with no problems. The only fly in the
ointment is when sockets are used. We haven't got them yet, but the
tcpip group on the MiNT mailing list are hard at work to create
them.

Simon.

Oh for Christ's sake, this is geting incredibly stupid. THE 68020 IN THE CD32 IS A 32 BIT PROCESSOR, OK? Okay, I'm gonna walk you through this one slowly:

(1) I say that the Jag is basically an A500 with neat GFX.
(2) You say "Yeah, an A500 with neat GFX will beat the CD32"
(3) I say that the CD32 IS, in fact, an A500 with neat GFX, but that it IN ADDITION TO its neat GFX, and IN CONTRAST TO the A500, HAS a 32-bit CPU.

Okay? Did we get it this time?

[...]

> |> Well, the data bus, you know, the bit of the CPU that communicates with the

> busses.

Yes, that's right! And what decides how fast we can get data to/from, for instance, your famous 64-bit DSPs? Even if they *do* have DMA (don't know about this), the data is going to have to get into memory somehow... And how will it get there? 16 bits at a time! Very good! And can the 16-bit bus of the 68000 read code 32 bits at a time? No! Gee, I guess there IS a difference between a 16-bit bus and a 32-bit bus, after all!

[...]

No? You basically ignored the fact that the 16 bit data bus is half as
efficient as a 32 bit databus. Well, I don't care what you call it, to me
that says you don't care whether you have 16-bit or 32-bit databus, which
means that they are equivalent.

> If your going to quote some one please be accurate.

I wasn't quoting. I was telling you what you said, in case you didn't
catch it while you were writing it, and why it was stupid.

You can always tell when Atari has a winner because Greg flames it. :)

From what it appears, no one here knows what the actual use of the 68000 is
in the Jaguar. So until we know for a fact whether it is the CPU or not,
it is probably best for everyone to be quiet.

But then, this being *.advocacy, I doubt this will happen. :)

Well the Amiga 500 is almost half the speed (7.16mhz) of the Jag (13.3mhz)
with the same processor.

Factor in the 64-bit Blitter and graphics, and the DSP, and we have something
that is a little bit ahead of the competition, being as though the current
market is inundated with machines running on 8/16 processors (SNES) or
16/32 processors (Genesis).

Also throw in the texture mapping, the ability to have as much as 50MB of
data compressed in catridge form, and of course, widespread knowledge that
the machine exists (look in the game rags... there are only "rumors" of
a new 32-bit SNES and Sega, and no mention of the CD^32... whereas Jag is
getting more and more mention as information has come out... tres interessant,
eh?).

I think Atari is lining up to have a killer machine out there that will
actually threaten SNES and Genesis sales.

And as much as you all flame away on it because you prefer CBM products,
remember that it doesn't matter how good the hardware is, but how well it
sells. :) If hardware were all that mattered, MS-DOS machines would have
faded from the scene when the 520ST and A1000 came out, right? :)

Maybe Commodore should advertise that AmigaDOS lacks memory protection so
we can all know the truth about that, too, eh? :)

I don't think you can flame a company for using advertising hype to build a
rep. I also don't think any of you cared to notice that many other video
game companies claim a 16-bit system when they still use numerous 8-bit
components (SNES is a great example of this... 8-bit DMA sound, 8/16 bit
CPU).

Also, it's a known fact that Jaguar has a 64-bit bus.

This is 2X bigger than the CD^32 and 4X bigger than the Falcon's 68030's
buss to memory. :)

>You know, they're getting pretty good at misleading the public.
>

So are the jealous Amiga owners. :)

That's simply not true. And I'd like for you to find an unhappy Falcon owner
posting to comp.sys.atari.st or atari.st.tech if you want to make a claim

like that, which is totally unsubstantiated.

Greg, if you're going to spout opinion, at least do it right and say it is opinion. :)

>a difference between a 16-bit bus and a 32-bit bus, after all!
>

You have missed ONE simple point.

The Jaguar, according to Atari, has a 64-bit buss.

Now, this may be like the Falcon, where between the 68000 and RAM there is
a 16-bit buss, and between the custom chipset and RAM there is a 64-bit
buss, and so on.

But considering these are true coprocessors who may get the odd command from the 68000... i don't see where they are going to have much of a problem running fast or getting fed only 16-bits at a time.

And if that is a problem, would you care to explain what game system exists or is coming where every chip in it runs at 32-bit (or greater) access to memory?

(other than the Amiga 4000 :) )

This becomes a matter of semantics. a 64-bit RISC based CPU would make it
in a class with the DEC Alpha. From what we've heard so far, the 68000 acts
as a CPU in the sense that it coordinates the actions of the other chips...
IF it even does that! <because we are all operating on a scrap of info>

I think they can claim it to be 64-bit RISC based IF the custom chips indeed
fall into that spec.

Personally, all I know is, for $200 there is nothing that will come close.
The biggest argument against any machine over $400 (like CD^32) would be
that if you're going that far, you may as well get a 3DO (The Sanyo model
may go as low as $550).

Correct me if I'm wrong, but I never saw any mention of the BUS being 64-bits
(and if it's not, it doesn't make that 64-bit processor as useful as it
could be).

As an aside, I really like how the specs were made to look a wee bit better
than they are by staing that it has 16 megaBITS of RAM, which is only
2 megaBYTES. ;)

Check the press release.

It has a 64-bit buss. There was mention of this even when the prototype
(which did not have the sound circuitry integrated) was shown to shareholders
about 2 months ago, I believe.

>As an aside, I really like how the specs were made to look a wee bit better

Well, yes, but this is true of all video game manufacturers. Would you buy
a SNES or Genesis if you knew it only had 64k of RAM? :) Heck, NeoGeo
has 330 MEG (abit) carts. Street Fighter came on a 14 MEG (abit, once again)
cartridge for SNES.

I really think if you are to survive in the video game advertising war, you
better go with the BITS for your measurable units instead of BYTES because
it would look pretty bad if they said 2 MEG (abytes) and the gamers all
thought it was a 128K machine. :)

A twisting of the truth, I'll venture. 32-bit access to ram, with the
optional burst page-mode access. It's a 32-bit bus though.

Greg

Well, even the "mighty" A4000 is stuck with several chips which do
not have 32bit access. The Paula chip is the same tired old dog
from the original A1000, except it has a cute little package. The
Blitter, once part of the Amiga's claim to fame, is still 16bit,
although the Alice chip may be able to access memory a bit faster.
The Lisa chip can grab memory in 64bit chunks, resulting in a 4x
improvement, but even it chokes on resolutions and color depths
which other machines handle easily. And last but not least, don't
forget that the A4000's 040 is far from being the best in the world,
and may rank among the worst.

Another factor that could (I suppose) affect all of this is the new high price of the Japanese yen, which could give a competitive advantage to the C=/Atari stuff against the Sanyo/Matsushita 3DO stuff. I assume this worsening exchange rate was the cause of Nintendo jacking up the SuperFX chip-price to the point where Lucasarts and (some other company whose name excapes me) decided to drop the chip from their planned cartridges. (I read about this SuperFX price thing in that annoying yet fascinating "Video Cowboy" syndicated newspaper column; I have no idea how reliable a source that is).

^^^^^^^^^^^^^^^^^^^^^^^^

Nonononnonono... not the Amiga 4000/40. That's Commode's top of the line
killer machine. After all, it was designed for the video professional not
an end user who needs.. ummm... whatever end users want. :)

Well it's nice to see someone else other than me thinks it is pretty cheesy
for people to complain about the lack of a 32-bit this and 64-bit that in
the Jag, which is touted as a 64-bit system. Maybe it is something with
our names... Skip... Flip.. probably someone named Drip will drop by and
enlighten us further. :) But my point is this... for the rest of the
masses...

The Jag is a nice machine with some very nice 64-bit components in it in areas where performance, for a video game console, are necessary. We know for a fact that console systems have done quite well, performance wise, with a load of specialized custom chips and a relatively slow CPU. Anyone who thinks otherwise should look at a TurboGrafx-16 (using an 8-bit processor!) and the SNES (8/16 CPU!). What makes them better game machines than some dedicated computers are the abilities of their custom chips.

And I doubt anyone here is going to argue that those machines would even come close to outperforming a Jag.

The only close competition will be from 3DO (at $550-$700 a pop, but with CD unit built-in, and the Tripster backing it up with EA Software) and CD^32 which, in case no one has noticed, is an A1200 with CD, but no keyboard and some other doodads.

Judging from the current response in magazines, 3DO is getting hyped a lot more than the other two, and Jaguar news is just bubbling to the print media, and CD^32, doesn't exist.

: KNOW what it is like!

Blame the Falcon's hype for how I treat the Jaguar, I see it no
differently now.

: <all because Commode is making a CD game console... which, according to

Again, this has NOTHING to do with CD32. The Jag beats the HELL out of
it, even if everything I said is true. Don't be dumb enough to think
that I'm not open enough to recognize a better machine when I see it, I
am. I just hate marketing, and that's marketing if I've ever seen it.

Fudged numbers, mistruths, that whole post reeked of twisting facts.
This has NOTHING to do with the Amiga, and everything to do with the Jag.

My problem with the Falcon is NOT Atari, and it has nothing to do with my
Amiga. My problem with the Falcon is the intentional crippling.

My problem with this Jag post is its intentional marketspeak.

Greg

: Are you talking about CD^32 or Jaguar? :)

Jag. It's a great system; but there have been lots of technically superior systems which lost simply because they were late to market. As is, CD32 has a lot of force behind it; the list of games in development and slated for release is over twice the size in that Jaguar post. As well, it's due for a world-wide release within a month; something the Jaguar isn't.

I -LIKE- what I see about the Jaguar; I just know marketspeak when I see it. That "technological peek at the Jag" was more marketing than it was specs.

: Yes, we all agree it is a very nice chipset. :)

Good.

: PROVE IT. Otherwise, don't say it.

Know anything about engineering? They're saying "64-bit" ram. And yet, suspiciously, they're saying, rather specifically, that they're using page-mode ram.

What is the logical conclusion? That they're making use of page-mode. Which MEANS that they're using a 32-bit pathway to ram, and using page-mode to get that second 32-bits.

NOW. We get to "64-bit". Again, the GPU for the thing is a 68000, a 32/16-bit cpu that accesses memory in 16-bit lengths. Regardless of how much function is actually taken by the DSP, it's still a DSP, and not the GP for the system.

Therefore, it's misleading to say it's a 64-bit system, when the main processor, even if superceded by other, faster processors, is 32/16.

Nothing about the Jag says 64-bit, except the fetch system. And that may or may not say anything about the chipset itself--you could easily stick 64-bit chips onto this 32-bit bus, and use the page-mode to do that second fetch.

But it's a lie to call that a 64-bit system in the same way that it's a lie to call an A2000 with a 68030 card a 32-bit system.

: Well, can I quote you on that? "Nothing wrong with...."

There is NOTHING WRONG WITH USING PAGE MODE. If there was something wrong with it, you idiot, it wouldn't be USEFUL, would it? No. But it is NOT A 64-BIT PATH.

Don't mince words with me, damnit, because I _DO_ know what I'm talking about. Nothing ticks me off more than some computer geek who couldn't tell a burst read from a page fault telling me that I'm a total fool. Especially when, for at LEAST once, I'm not.

: Great point. :)

It's NOT a point. I don't GIVE A DAMN ABOUT THE CD32. IT'S TECHNICALLY INFERIOR, AND THAT ISN'T WHAT THIS DAMN POSTING WAS ABOUT.

Excuse me for thinking that you WOULDN'T want to be mislead by marketing. I'm sorry, I mistook you for someone with intelligence, someone who thought that maybe they wanted to know what was REALLY going on under the hood. I thought maybe you cared how it worked, maybe you thought that not everything is as rosy as it seems.

I guess I was wrong, my apologies. Feel free to believe everything you read, and I hope it gets you everything you so dearly deserve.

: But Greg has forgotten.....
: VIDEO GAMES DON'T NEED A GOOD GENERAL PURPOSE PROCESSOR!

That depends on how "RISC" their DSP is. It may be desperately needed, it may not be. It WILL be needed, in some capacity, that is known: or it wouldn't be there. If their DSP is TRULY RISC, and it follows the RISC philosophy, then it may very well be that a GP will get a good bit of use, even in games, if for nothing but to direct the flow of everything that goes on.

: That's all you needed to say. End of story.

If you really think that's all there is, then you're a fool. Go ahead, follow marketing blindly. Personally, I like to have some knowledge of what I'm buying.

And I'd be awfully interested, if I were a more intelligent version of you, why they are so bent on misrepresenting their own features.

Greg

Sorry, but I think you are. The claimed memory bandwidth is consistent
with a 64-bit wide page-mode DRAM system. There is simply no
information available to say otherwise.

Calling a DSP "RISC" is just silly. The term doesn't apply.

There are at least 3 processing units with 64-bit connections. The fact that the BLITTER, GPU, DRAM controller, and OBJECT PROCESSOR are all in the one chip ("Tom") may have confused you.

Here's an ASCII version of the block diagram posted with aeo_se_j.zip to atari.archive.

1 = 16 bit bus
3 = 32 bit bus
6 = 64 bit bus

```
....JERRY........... BUS
: : 6

: believe that it runs the whole thing. Could it possibly be that the
: 68000 is just an ancillary processor, not the main processor?

Um perhaps you're right. Then what tools do you use for cross-development?
Are there 680x0-> whatever risc processor Atari have made
or is there away of developing this you-beut risc microcode?

How are you going to work out the rules for your game, the mechanics,
and then compile it for "risc machine code"?

Are programmers going to manually change every bit in the Jaguar
by hand until they can snapshot the memory?

I have a strong feeling that the 68000 is the main processor
and the risc whatever it is, is just a graphics co-processor. A few
cheapish dsp's might be in the box as well. Also, the specs sound
very dodgey, especially the 100MB/sec bandwith, probably Megabits (Mb),
not megabytes (MB). The MIPS figure sounds awfully fast, fast
enough for Atari to sell the risc chip to others as a cpu. Then
again, I guess the MIPS figure is just adding the 68000 (all 2 mips of
it), to the risc chip and the dsp..

- Jim

PS. Apart from Economics and a bit of Civil Engineering, I know
nothing, so any compuuter-techno stuff is probably wrong ;-)

## 1290. Jaguar Architecture

Newsgroup: comp.sys.atari.advocacy
Date: 1993-08-31 05:01:30 UTC
From: bgilbert@hardy.u.washington.edu
Message-ID: <25ulva$epv@news.u.washington.edu>
Source record: 22023

To all the people who keep claiming the Jaguar is some sort of 8/16/32 bit hybrid running off a 68000 or some such nonsense, I would strongly advise downloading and viewing the Jaguar architecture diagram which was posted in the last Atari Explorer Online. This may be found at the following site :

atari.archive.umich.edu (try msdos.archive.umich.edu if busy)
/atari/Magazines/Aeo/aeo_se_j.zip

This is a pretty detailed pic (same thing Warwick converted to ASCII) of how the memory, bus, chips, etc. are setup in the Jaguar. There _is_ a 64 bit bus, the memory is accessed via the 64 bit bus (not through 16 bit references via the 68000 as someone suggested) and there is no valid argument that the 68000 will somehow "slow down" the system. Heck, I could have a VIC-20 feeding 3-D object coordinates to a Cray-XMP which would then do the rendering pretty darn fast, but you wouldn't say this was only as fast as the VIC-20, would you? Just because the 68000 is there doesn't mean it will be doing most of the work in the system -- I think it will be quite the opposite, the specialized chips will be doing the brunt of the graphics work. It doesn't take a 68040 to calculate how many lives the player has left or figure out which monsters are going to attack.

Regards,

# 1291. Time-Warner was Re: Can CD-32 vs Jaguar?

Time-Warner, mega-media-conglomerate, parent company of Time Magazine, Warner Brothers Records, and the American Broadcasting Corporation (ABC), as well as countless other newspapers, magazines, TV stations, etc. Why the hell is it that this company is interested in Atari?

It is pointless to speculate which console will do best, because there are too many factors. CD^32 seems to have better games support, while Jaguar has a nice list of specs and some sort of connection with Time-Warner. ETC.

The CD^32 also isn't known outside of Commodore's HQ. Have you seen a single
advertisment in any game magazines, computer magazines, or ANY magazines for
CD^32?

Commodore has little credibility to the buying public as a computer maker,
and NONE as a video game company.

>I -LIKE- what I see about the Jaguar; I just know marketspeak when I

And no matter how much you speculate, you can't back up what you say as
fact until the full specs are out. Then, if you are correct, you have the
right to run rampant in the *.advocacy groups yelling like a scorned prophet,
but Greg, my whole point is that despite your claims to the contrary, you
are flaming Jag for being... well... advertised with the same meaningless
hype attributed to other video game companies.

If you feel so strongly about how many bits are in a system, I'd like to
hear your ideas on how 16-bit the SNES is with its 65816 CPU and 8-bit sound.

Then I'd like to hear how late it was to market.

And how it didn't sell.

And how wrong you are.

>But it's a lie to call that a 64-bit system in the same way that it's a
>lie to call an A2000 with a 68030 card a 32-bit system.

Greg, you're getting very emotional.

Face it, you're flaming all things Atari, and this time, you are stuck trying
to grasp at straws the way you always do.

Did you have a traumatic experience with an Atari VCS as a child? :)

>Don't mince words with me, damnit, because I _DO_ know what I'm talking

Ok, Greg, you've made your point.

The CD^32 is vastly superior to the Jaguar because you know all about this
kind of thing, and I am saying this mainly because I'm a computer geek and
you'll kick my ass if I don't agree with you, Mr. Page Fault. :)

So, other than personal attacks, and speculation, what else is in your post?

>It's NOT a point. I don't GIVE A DAMN ABOUT THE CD32. IT'S TECHNICALLY
>INFERIOR, AND THAT ISN'T WHAT THIS DAMN POSTING WAS ABOUT.
>

Greg! I'm shocked! Could you be using caps so much and ranting and
speculating because... an Atari box is superior to the competing Amiga
box?

And you, like many other computer users, have confused your computer with your
religion?

I'm definitely Atari-biased, but there's a limit... perhaps it is called
netiquette... and I sincerely believe one shouldn't go around bashing
machines before you have the full information.

Even video game consoles. :)

>Excuse me for thinking that you WOULDN'T want to be mislead by
>marketing. I'm sorry, I mistook you for someone with intelligence,
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
People frequently do that. Perhaps that's why I have my CS degree. :)

>someone who thought that maybe they wanted to know what was REALLY going
>on under the hood. I thought maybe you cared how it worked, maybe you
>thought that not everything is as rosy as it seems.

Or perhaps I know how videogames are marketed, and I know the full specs
probably better than you do (as you've probably only seen them for the
first time within the past 48 hrs.), and after putting 2 and 2 together and
getting 4 (just like every other time in my life :) ) I've found that
I like the machine, and while it isn't the 8th miracle of the world or the
2nd coming of Christ, it certainly seems to be a very viable console unit
to entertain the family with.

>I guess I was wrong, my apologies. Feel free to believe everything you
>read, and I hope it gets you everything you so dearly deserve.

>of use, even in games, if for nothing but to direct the flow of
>everything that goes on.
>

Yes, that is correct. But I'll stand by my original statement.. my basis
for my claim is this:

1) so far, the advantage of a more powerful CPU seems minimal provided a console gets better performance out of its graphics and sound units.

Proof:

SNES vs. Genesis. The 65816 vs. the 68000. SNES is loaded with a nice set of custom chips, actually superior to the Genesis'. Better graphics, better sound, better scaling & rotation. The SNES, even though it doesn't have a 68000 can perform 3D rotation faster than a Genesis, and if you've ever tried a Mode 7 game, you'll see the Genesis cannot really keep up with that. Also, the Genesis sometimes have sprite flicker (if you ever play madden '93 on the Genesis, you'll see it whenever you get ready to call a time out and some of your players disappear).

2) the main CPU has to do very little with the speed of the overall system

Proof 1: TurboGrafx-16. There is an excellent title out right now only in Japan, but it is their version of Street Fighter II ' which is amazing, considering their CPU is 8/16 bit, as is SNES' but like SNES, their custom chips are on par or better than the Sega's.

Proof 2: Look at your Amiga. How many times have you argued with PC owners about how much faster the Amiga is graphically? (well, maybe in 1990 :) )

I would suggest you study the Jaguar specs more carefully, and then post.

I'm sure someone at Commodore must share you feelings about marketing, because if they had felt differently about it in 1987, they wouldn't have a soon-to-be orphan machine on their hands.

>
>My problem with this Jag post is its intentional marketspeak.
>

Greg, have you ever played with a NeoGeo?

I think you'd enjoy seeing their 330 MEG (abit) cartridges. Their system has such novelties as a Z80 helping the sound subsystem and a combination of some very interesting, but ancient, technologies, into a killer arcade box.

If you for one second think a console manufacturer can use the same terms we use to converse in the computer industry and sell machines, then you are welcome to that opinion, but if the gamers think MEG means MEGABITS, and you mean MEGABYTES, they'll think your product is less powerful than it is.

Likewise, if you include 64-bit components in your system, you might be justified in saying it is a 64-bit system, especially when it comprises your video and a major part of the processing for your system.

If you can't understand that, then you can't understand why Nintendo has money and Commodore is losing it.

Where did you get that from? The 64 bit RISC is the MAIN PROCESSOR in the
Jaguar even though it's a graphics processor ..

|> "big deal" indeed!
|>
|> - Jim
|>

Well if the 680x0 is used only for controlling silly little things like
button input and setting up of the sound system, then there will be no
noticable difference in system throughput. So the fact that it has a 16 bit
bus is no "big deal".

EVERYONE STOP DOING SYSTEM ANALYSIS ON A VIDEO GAME CONSOLE WHEN YOU DO NOT
KNOW THE DESIGN REQUIREMENTS! But then again these are the same people that
thought the A1200 would be a Falcon killer (because of the Falcons 16 bit
bus). But after doing the timing comparisons they shut up pretty quickly.

When I was at Lockheed we did make a 68040 to 68000 adapter card and while
the 68040 was hurt by the 16 bit bus (about 60% with no chaches enabled).
It is still a very fast processor. Most of the degradation had to do with
the 8 state bus accesses of the 68000 motherboard vs the 4 state accesses
the 68030/68040 enjoy.( The bus snooping feature of the 040 was not
implemented at that time :( )

What SOME PEOPLE are still missing is that the 68000 will not have to do the
major part of the work, graphic rendering. There is another whole chipset for
that. And if you do not think that rendering is where the majority of your
time will be spent, then try writing a busy animation that uses a 320x200 area

and send a character out the serial port after every frame. The results will astound you, even if you choose a monochrome display.

In the latest Amiga Format, the UK Commodore guy states that they have NO PLANS to sell the CD32 in the US at present. They're going to concentrate on the Europe market; not surprising considering how much a US campaign would cost, and how low they'd have to set their price there compared to Europe.

They *might* sell it in the US if it really takes off, but officially there are no definite plans. Nomatter what, they don't foresee it being launched in the US for six months to a year.

Meanwhile, AFormat has a CD32 booklet with the mag, with some comments by Lew Eggebrecht on the CD32 design. He mentions the S-Video port, saying that S-Video is popular, and adds "I'm not sure about the UK, but in the US almost every tv you can buy has one."

Not sure about the UK? Maybe they should have asked somebody :) Weird to include a port that you know is used in a country you don't intend to SELL in, while forgetting to check on your actual market.

Anyway, what exactly is S-Video, is it a waste of space, and is it like SCART?

Other titbits... A1200 CD32 add-on will be available soon, but the A4000 version is some way off. AFormat mention that, as the add-on goes into the trap door, you won't be able to use the CD drive with any other expansions. Peripherals to allow the CD32 to be used as a full A1200 will be left to third party support.

Microprose mentioned that they want to do a CD32 version of F1GP, but not unless Commodore comes up with more info on plans for disk drives and the like; they said that C= has to keep developers better informed than they currently are. There was loads of other game info, but nothing specific that I can remember.

Don't be glum, US. CD32 is bound to sell billions in Europe and become so well known that every American will want one, so Commodore can sell it there too, ushering in a new era of peace and happiness! (It'll at least do fairly well...)

Where do you get this information? I don't know whether or not you are
right - you easily could be, but on the other hand, it would be just
as easy for them to have provided a true 64-bit bus. One of the points
is that we *just don't know* - the only information we've gotten is
truly suspect.

Actually, I believe Warner unloaded Atari Games some time ago. However,
they undoubtedly still have a financial stake in Atari Games just like they do
in Atari CORP. (Time-Warner owns 25% of Atari CORP.)

I had a vague suspicion I was exaggerating this, so I checked back with the AF booklet. The *actual* gist was this: a US release in this quarter is "unlikely", but if all goes well a release early 94 may be on the cards. Okay, my memory is knackered. I'm trying to be pessimistic so I can be "pleasantly surprised" at how good things turn out.

Hey, when Atari actually MAKE a jaguar you Atari-heads can argue
that it`ll kill the CD32.

Until then, its VAPOURWARE and IMHO will *never* appear.

Listen up

THE JAGUAR DOES NOT CURRENTLY _EXIST_

Lets all hope it`s as big a sucess as the Amiga-killing `Falcon`

I was told by a developer/Amiga dealer who left me E-mail that CD32 will be
released at the WOC show.

The developer also said that there was an expansion box hack for CD32 available
for Amiga developers. Did not state if this would be a commercial product.

So, does this mean that the A1200 add-on will be available in the U.S before
the standalone model is available in the U.S.? I own an A1200 and I'm really
hoping that the add-on model comes out right away. I might buy one if the
price is right and I can use it as a regular CD ROM drive.

BTW, I've heard that you can get some kind of doodad that would allow you to put more than one card inside the trap door in the A1200. So, if I bought this then would I be able to use a CD32 and a RAM board or accelerator card in my A1200 at the same time? I certainly hope so. I'd like to buy the CD32 add-on when it comes out but I'd also like to be able to put some RAM or an accelerator card in my A1200 too.

From the Amigoid posts around here I thought the A1200 was supposed to be the Falcon killer :) Amazing how things get twisted around in these groups.

>Nonononnonono... not the Amiga 4000/40. That's Commode's top of the line
>killer machine. After all, it was designed for the video professional not
>an end user who needs.. ummm... whatever end users want. :)

It looked like what I wanted, and seemed really awesome compare to
the A3000 that I had previously. But when compared to its
contemporaries, it looked pretty miserable. The response from the
Amiga faithful is crap like "but it's not a high-end machine!" and
"well, it still multitasks better!" etc. Okay, fine, if its not a
high-end machine, why in the hell does Commodore price it like it
is? Sheesh, the damn thing has a perceived value of around $1500,
and that's still too high when certain factors are considered.

>Well it's nice to see someone else other than me thinks it is pretty cheesy

>and the SNES (8/16 CPU!). What makes them better game machines than some
>dedicated computers are the abilities of their custom chips.

Until the A4000 came along, it was common for Amiga Advocates, myself
included, to boast how the Amiga was not crippled like other
computers. My how things change.

>And I doubt anyone here is going to argue that those machines would even come
>close to outperforming a Jag.

Actually, my money is on the 486 VLB systems that will start appearing
next year with CDROMs and VGA-TV boards...

>The only close competition will be from 3DO (at $550-$700 a pop, but with CD
>unit built-in, and the Tripster backing it up with EA Software) and CD^32
>which, in case no one has noticed, is an A1200 with CD, but no keyboard and
>some other doodads.

Don't forget the Akiko! It is the miracle chip that is going to make
the CD32 blow away everything else!!!!!

>Judging from the current response in magazines, 3DO is getting hyped a lot
>more than the other two, and Jaguar news is just bubbling to the print
>media, and CD^32, doesn't exist.

CD32 hasn't gotten a single shred of coverage in the mainstream press in this country. Hell, if I didn't read about it on the Internet, I doubt that I'd have even heard of it! Commodore should name the damn thing "Stealth32" instead, because they appear to want to keep it hidden...

Yes. That is what Atari has said. It would be harder to have a
68000 as the main CPU because of the limitations of that chip to
interface with a 64 bit bus.

The 68000 is used for auxiliary purposes. I don't remember exactly
what. I will try to find out (reliably).

Some people here seem to think having a 68000 in the machine means
that the 68000 is the main CPU (see my post "You people are fucking
unbelieveable). Does that mean that at Atari 800 uses the Antic as the
main microprocessor? I assume that is implied by this lune of
thought...

It is a tribute to the Jaguar that it would be of any benefit to have
a 68000 as an aux. proc. Although the 68000 is very cheap these days,
it is not as cheap as many other processors out there with less power.
You can be assured that Atari would not spend more than they had too
(they typically will rather cut cost at the expence of the
upgradeability and even power). If the Jag needs a 68000 as an
auxillary processor, you can be assured it is going to be quite
powerful.

Make that 'release within a week' or even in the next two days according
to a few retail outlets. :)

It comes with two games, Diggers and Trolls I think, and has been
advertised as 285 UKP.

First you admit that the Atari beat the '486 on a benchmark, then
you say you'd like to see evidence of a benchmark showing a '486 being
outperformed by an Atari. Isn't that being rather inconsistant?

>What the hell is an "MS-DOS machine"? They're called PC's. They are
>Intel 80x86-based personal computers. They run MS-DOS and Windows,
>and WindowsNT, and NeXTStep, and OS/2, and Solaris and countless other
>versions of UNIX...

PC stands for "Personal Computer", and can be represented by MS-DOS
machines (Intel boxes, if you prefer, but such a designation is
probably not appreciated by Advanced Micro Devices, Cyrix, etc.),
Amigas, Ataris, Acorns, MacIntoshes, et. al. Unless you mean *all*
personal computers when you say "PC", you should specify the type
of PC you mean. Hence: MS-DOS machines.

>What software?

For starters, I listed the software running on my machine.

>Is this relevant? I don't think so. ("My computer is better than
>yours because the software it runs runs better on old computers than
>your software runs on old computers!")

Sure it's relevant -- it means that I'm not forced to perform expensive
system upgrades every few years just to keep up with new software
releases. It's an indication that Atari users are not as subject to the
"planned obsolescence" that's so prevalent in the MS-DOS world.

Oh yes, the lucid comment on our believability. Gosh, did you train to be so cogent, or does it come naturally?

OK, now for the meat:

y MC68000 CPU clocked at 13.3 MHz as a general purpose control processor.

A direct quote from a jaguar technical doc someone was kind enough to send me. Not the words "CPU", "general purpose" and "control". Now, where I come from, CPU stands for Central Processing Unit. Note the words "central" and "processing".

Yeah. But from the docs I have, it ain't auxiliary.

Hint: Everything else is specialized... Lemme put it this way. If Commodore, in 1986, had chosen to use a 6502 as their main processor in the Amiga, I'd have felt much the same way about the Amiga then as I do about the Jaguar now. Powerful copros, crap CPU. Thank God

C= saw sense. Maybe Atari will, too.

Could you tell me where I can buy a CD 32 TODAY? Hmmmm. Seems like vaporware to me as well.

Atari does have ACTUAL units. Some are being used as development consoles, some where shown at the shareholders meeting, and the press release.

You might argue that like the Falcon, the Jag will come out late...but you can't say they don't _EXIST_ as people have seen them already.

I think you are oversimplifing the comparisions. If you think the CD 32 will just waltz in and take over the game market, try again. At least Atari HAS an image in the game console market--they helped create it.

Right now, it's too soon to tell WHAT is going to happen.

Don't worry, that CD 32 toy will probably like as a kiosk machine for awhile yet to come....

Well, it's not a 32-bit CPU. DO you know the difference or not? Do you want to perhaps argue against Motorola?

IT *IS* a big deal. One of the greatest improvements in performance for the '20, '30 and '040 is that they have a 32-bit data path. Without this those chips suffer *big time*.

Just in case I like the Jaguar, but I can see that you are making false conclusions.

Just in case: yes, I can believe those custom chips are really
good, and just in case I would not say the system is bad 'cause it
uses a 68000 as CPU. After all, the custom chips is what matters
a lot. Now, I am also in for validating 'ATARI's specs'... there
was hype about the Jaguar using 64-bit RISC *as CPU*.

|> Let me see an A500 has a 68000 for its processor, and it is a 32-bit CPU.
|> But the 68000 in the Jaguar is not a 32-Bit CPU. NEAT TRICK!!!!

Look kid, he meant in figurative terms. The CD-32 is an A1200, and it uses
a 68020, not a 68000. Okay? YES, the 68000 is a 16-bit CPU (16/32 hybrid),
Okay?

[stuff deleted]

|> Yes Motorola makes the 68000 familly of processors, all of which are 32-bit

|> busses.

I suggest you to talk to Motorola or open a Motorola catalog for that matter.
They don't classify the 68000 as a 32-bit processor, but exactly what you said: 16/32.

Well, then Greg made an exception with the Falcon I guess :-)

True. I guess that the 64-bit graphics processor does the CPU tasks
and the 68000 is being used by the graphics processor to do the Graphics Goraoud shading
:-)

|>
|>

Seriuosly, the only thing I can think the 68000 will do (besides being a CPU) is
just controlling the ComLynx ports and stuff like that.

And what do you think the Jaguar is for ATARI flip?

Mind you, I like the Jaguar from what I have read, but I would
also like de-hyping it a little. While I wouldn't bet on what GReg
said, it sounds like it could be true...

OPINION MODE ON

No offense intended, but I am starting to find this thread boring. If I want to read a lot about the Jaguar, there are other places to research that information. We have pretty much covered the "I really like it/It really stinks" discussion.

To me, the major factors are product, pricing, promotion, and placement (distribution). Included in product are the specs and in this case the available software from third party vendors. If Jaguar has these pieces, then it will be successful.

I am actively working, along with many others, to get sufficient developer support for the Amiga CD32. I believe we have had some success, signing up companies such as Mindscape, Ocean, Grandslam, Flairsoft, and many others. We will continue to add more, so that there are a lot of good titles.

I think that Jaguar is an excellent machine from what I know of it. I do not know of any software vendor who has announced a committment and a plan for specific titles and release dates for the machine, but that may be my ignorance.

Regardless of the machine, you need to have the "4 Ps" (product, price, promotion, placement) to be successful. And in this case, the product must include a lot of third party software.

Just my opinion,

John

Atari had no plans to sell the RISC processor. It is fairly
specialized. Probably does not support a lot of Virtual Machine aspects
and things like that.

>PS. Apart from Economics and a bit of Civil Engineering, I know

Well, the CD^32 does in a sense compete with the Jaguar which is after all
just a piece of paper. :-) But, seriously lets don't judge the CD^32 and
the Jaguar by specs alone. Lets see which comes out in the U.S. first, how
much the games typically cost for each system, how much the CD add-on will
cost for the Jaguar, and so on. I think the CD^32 has the *potential* to
become something more than a game machine. It would appear that the Jaguar
will remain as something that's only good for games. IMHO, I'd rather buy a

CD^32 add-on unit for my A1200 rather than buy a *standalone* game machine like the Jaguar. But, that's just me I suppose. If I didn't already own an A1200 then this wouldn't be a selling point for me on the CD^32. In my case it is. I'd like to be able to get stuff like multimedia versions of dictionaries, encyclopedias, and the like. I'm hoping that the CD^32 will be able to eventually offer me more than just games alone. Because the CD^32 can be expanded into a computer and because add-on units will be coming out for the A1200 and A4000 there is a pretty good chance of this kind of software coming out for the CD^32. IMO, the Jaguar doesn't have this kind of potential. Think of the Jaguar as a paper tiger. It looks good on paper but will it deliver the goods? I have my doubts.

I saw a short blurb about the CD^32 in a game rag (I think it was Electronic Gaming Monthly). This is where C= should advertize the CD^32. SNES and Genesis owners read these type of magazines so CD^32 ads in these mags would be likely to reach its target audience--people who would actually might like to buy one. This is something that I'm going to mention in my upcoming letter that I'm going to send to C=.

They can announce and show CD32 in Pasadena without
'launching' it. There is oten a lag between the unveiling of products
and when they hit the streets. If the 6 month thing is true, C= must
intend to focus heavy on a happy Euro-X-mas.

>>I would like to see anyone cite benchmarks in which a 486/66 (or for
>>that matter any 486DX) running a 32-bit operating system was
>>outperformed by an Atari computer. Good luck.
>
>First you admit that the Atari beat the '486 on a benchmark, then
>you say you'd like to see evidence of a benchmark showing a '486 being
>outperformed by an Atari. Isn't that being rather inconsistant?

No. You didn't read very carefully. I said I haven't seen any benchmarks in which a 486 running a 32-bit operating system was beaten by an Atari. The one cited was run under DOS, right? There is a huge performace boost running 32-bit applications on 80x86 systems. And if you are so sure the Atari is faster, why didn't you cite another benchmark besides your Mandelbrot test?

>>What the hell is an "MS-DOS machine"? They're called PC's. They are
>
>...Amigas, Ataris, Acorns, MacIntoshes, et. al. Unless you mean *all*
>personal computers when you say "PC", you should specify the type
>of PC you mean. Hence: MS-DOS machines.

Well, maybe that's how things work on this newsgroup, but everywhere else people know what PC means. Why do such publications as "PC Magazine", "PC Week", "PC Sources", "PC/Computing", etc. etc. all deal with only Intel-based machines? You can call your computer whatever you want, but I'll stick with established usage. A Mac is a Mac, an Amiga is an Amiga, an Atari is an Atari, and a PC is a PC. Even if you don't agree with that, to call them MS-DOS machines is ridiculous, given the fact that the number of operating systems for the 80x86 line numbers in the double digits. Compare the latest Atari to an "MS-DOS machine" (how about one with no local bus?) and it will probably win. Compare it to a 486 running OS/2, and it will not. (Might that be why you keep referring to MS-DOS machines?)

>>What software?
>
>For starters, I listed the software running on my machine.

What do you mean "for starters"? Doesn't that imply there is more to list? If so, why didn't you do so?

>>Is this relevant? I don't think so. ("My computer is better than
>>yours because the software it runs runs better on old computers than
>>your software runs on old computers!")
>
>Sure it's relevant -- it means that I'm not forced to perform expensive
>system upgrades every few years just to keep up with new software
>releases.

Only if you assume that because your current software runs on your ST then software 3 years from now will run on your Falcon. Then again, that's probably how long it will take for Atari to use a 68060 in their systems...

> It's an indication that Atari users are not as subject to the
>"planned obsolescence" that's so prevalent in the MS-DOS world.

Well, in three years when the Motorola 680x0 line is totally obsolete, where will you be? Still running all your software on an ST? How impressive will that be?

pab@dcs.ed.ac.uk (Alan Blair) writes:

>Anyway, what exactly is S-Video, is it a waste of space, and is it like SCART?

A week or so back, I explained in an article that, if you're using a console or computer with a TV or monitor, using composite NTSC or PAL, there's no point going to high resolutions, because the way that the colour signal (chroma) is mixed in, on top of the luminance, limits the visible resolution. It's a limitation of the NTSC/PAL standards, not the computer generating the video.

S-Video improves on this by separating chroma and luminance - they never get mixed. Now, the way the human eye works is that it resolves differences in light level much better than it does colour. In S-Video, the bandwidth of the luminance signal is much higher than with composite. So, the visible resolution ends up being much better, even with exactly the same computer and monitor as before. Interestingly, the C64 used to have separate mono and composite outputs, which sharpened up the image on monitors that took both inputs, like the 1701.

SCART gives you, not only composite video, but access to the raw RGB and sync signals, as well. That way, there's no decoding needed, so that gives you the very best possible quality.

skip@cy.cs.olemiss.edu (Skip Sauls) writes:

>>You mean Commodore crippled the A4000 with a 16-bit Blitter?!?!!? Why,
>>even the Atari Falcon has a 32-bit Blitter!

>I wonder why no one has come out to argue with me about this point.
>Could it be that they know I'm right?

Yes, of course we all know the AGA chipset has the same 16-bit blitter that
the Amiga chipsets have always have. It's still a nice blitter, though,
just not as fast as we'd like.

> Sheesh, I expected at least
>a post or two from some bozo who believed the blitter to be 32 bit,
>"cuz' Commodore wouldn't name it CD_32_ if it wasn't!" :-)

And you know very well that CD^32 has 32-bit CPU, RAM, ROM and chipset
access. Despite the *internals* of the chipset, the architecture is very
much 32-bit.

> Okay, fine, if its [A4000] not a
>high-end machine, why in the hell does Commodore price it like it
>is?

Supply and demand. Supply is very limited, unable to meet demand, therefore
there is no market incentive to reduce the price. We've discussed this - I
don't claim the situation is a good one. I'm just explaining why it is that
the price is high.

>Until the A4000 came along, it was common for Amiga Advocates, myself
>included, to boast how the Amiga was not crippled like other
>computers. My how things change.

How is the A4000 "crippled"? As in, CPU on 16-bit bus, or polled SCSI, or
slow expansion bus? The memory design doesn't let the '040 run at full speed.
I'll give you that as "crippled". Was that what you were talking about?
And remember that there's a lot more to architecture than the graphics chipset.

>Actually, my money is on the 486 VLB systems that will start appearing
>next year with CDROMs and VGA-TV boards...

Heaven help us if that's true. The neat thing about 3DO and Jaguar is that
they're designed from the ground up - no kludges to be seen. The last thing
I want to see is more bits hacked together in a x86 box. "VGA-TV boards",
indeed!

>Don't forget the Akiko! It is the miracle chip that is going to make
>the CD32 blow away everything else!!!!!

Surely you jest, sir. No, it's not a miracle chip. But, I find it ironic that, just as there was lots of discussion here about chunky vs planar, and how the Amiga can't do some things well because of the planar architecture, Commodore surprise us by addressing the issue with (part of) a dedicated chip. But, was there a single good word to be said about this? No, all there is is "CD^32 is all very well and good, but it will never sell anyway". I don't know... :-(

Correct me if I'm wrong, but I certainly don't think I am.

One could theoretically achieve that performance level through 32-bit,
60ns ram, using page-mode to read a full 64-bits, and the number would be
extremely close to 107 mb/sec.

: Where do you get this information? I don't know whether or not you are

Nowhere. In the same way that the "27 MIPs" figure probably refers to
MHz, for more than a few reasons (including the 3.58MHz figure for NTSC
graphics), the 107mb/s figure given seems to fall very close to that of a
perfect-case, 60ns 32-bit page-mode system, if I did my math right. I'm
not altogether sure I did, but I think the fact that they give numbers
like "27 MIPs" and "107mb/s" means that they're giving SOME kind of
number which could be verified. If you've got an answer, and you know
there are very few questions which fit that answer, and you've got some
clues, like "fast page mode ram", you can try to deduce what the question
was.

: The CD^32 also isn't known outside of Commodore's HQ. Have you seen a single
: advertisment in any game magazines, computer magazines, or ANY magazines for
: CD^32?

Actually, yes. But don't expect much press coverage until release time...

: Commodore has little credibility to the buying public as a computer maker,
: and NONE as a video game company.

Some could say the reverse about Atari, just to make a point.

: Which is what you have to do to generate excitement and sell machines.

Thanks for informing me that one has to lie to me to excite me. It's not
something I ever noticed, thanks!

Not.

: And no matter how much you speculate, you can't back up what you say as
: fact until the full specs are out. Then, if you are correct, you have the

What kind of specs? Specs like those just released? Ha. You won't even
know the truth then.

: right to run rampant in the *.advocacy groups yelling like a scorned prophet,

I don't WANT to do that. But it's about time SOMEONE took a close look
at those numbers.

: If you feel so strongly about how many bits are in a system, I'd like to
: hear your ideas on how 16-bit the SNES is with its 65816 CPU and 8-bit sound.

It's not.

: Then I'd like to hear how late it was to market.

It was.

: And how it didn't sell.

It's not a Genesis, is it, twit. The Genesis is widely becoming the most
popular "16-bit console" on the market. That's no lie, and there are a
lot of people who are watching Nintendo's market share drop out from
under them.

: Is it? Perhaps we should sue TurboTechnolgies for putting an 8-bit CPU in
: their "16-bit" system. :)

If only we could.

: Face it, you're flaming all things Atari, and this time, you are stuck trying
: to grasp at straws the way you always do.

I'm not claiming everything I'm saying is fact. But do you think it's coincidence that they say "107 mb/s"? Do you think it's sheer accident that they chose the number 27 to say how many "MIPs" a graphic engine can perform at?

: Did you have a traumatic experience with an Atari VCS as a child? :)

No, I had a traumatic experience with an idiot. And day after day, I keep having it. Surprise, I'm not talking about a mirror.

: So, other than personal attacks, and speculation, what else is in your post?

Nothing. It was, quite OBVIOUSLY, speculation, I wouldn't push it off as anything BUT that.

: speculating because... an Atari box is superior to the competing Amiga
: box?

No, it's because you're being a thick-headed ass, and disputing what I say simply because you think I'm saying it as an Amiga advocate and not as a person who wants to try to set aside the bullshit and figure out some REAL specifications from that list of marketing dribble you're so willling to feast upon.

: And you, like many other computer users, have confused your computer with your
: religion?

Have you read a single word I've typed, you idiot? This has NOTHING to do with the Amiga, nothing to do with Atari. This has to do with a list of marketing-twiddled specifications, and a curiosity as to how the sucker works.

That's as far as it goes, and it's as far as YOU go.

: People frequently do that. Perhaps that's why I have my CS degree. :)

Ahh, as us engineers always say, that explains everything. :)

: probably better than you do (as you've probably only seen them for the
: first time within the past 48 hrs.), and after putting 2 and 2 together and
: getting 4 (just like every other time in my life :) ) I've found that
: I like the machine, and while it isn't the 8th miracle of the world or the
: 2nd coming of Christ, it certainly seems to be a very viable console unit
: to entertain the family with.

No shit, sherlock. I think the same.

That DOESN'T mean I don't want to know what makes it tick, and that's what this whole bit of speculation on my part was about. Sometimes, I think you don't even bother reading what you post about.

: 1) so far, the advantage of a more powerful CPU seems minimal provided a
: console gets better performance out of its graphics and sound units.

That depends on how much the system has to rely on that CPU. It's the
difference between a 56001's need to be "babysat", and the 3210's ability
to take care of itself.

: SNES vs. Genesis. The 65816 vs. the 68000. SNES is loaded with a nice set
: of custom chips, actually superior to the Genesis'. Better graphics, better
: sound, better scaling & rotation. The SNES, even though it doesn't have
: a 68000 can perform 3D rotation faster than a Genesis, and if you've ever
: tried a Mode 7 game, you'll see the Genesis cannot really keep up with that.

But is this the general case, one asks? Yes, it can do some tasks
quickly, but by in large, does that (2? 4?)MHz 65C816 hurt you?

Most kids I know think that the Genesis is better, even if the SNES can
do a few cool things.

: I would suggest you study the Jaguar specs more carefully, and then post.

They don't give you any specs. They give you marketing. Specs are
something you've got to DIG for in that, something nobody is willing to
do, it seems.

Greg

: Doesn't follow.

Do the math for a 64-bit architecture doing page-mode at 60ns and a
32-bit architecture doing page-mode at 60. Do the same at 80.

Now, tell me. Which is closer to the "107 MB/s" number given? I'll
leave you to answer that.

: Sorry, but I think you are. The claimed memory bandwidth is consistent
: with a 64-bit wide page-mode DRAM system. There is simply no
: information available to say otherwise.

Oh, it's consistent with it, all right. As a matter of fact, a 64-bit
wide page-mode system can go a lot faster than that at 60ns. But it's
right around the 32-bit area. And why would they post anything other
than maximum throughputs?

: Calling a DSP "RISC" is just silly. The term doesn't apply.

Oh, yeah it does. "RISC" in opposition to "GP". In the same way that
the 3210 is closer to being general purpose than a 56001 is.

Any clearer?

This is one point I'm not sure you're correct on. I'm not going to start
a Genesis vs. SNES war, but in case you didn't know, the SNES had a game
called Street Fighter 2 long before the Genesis version was even announced.

This game generated a LOT of SNES purchases.

Judging from the way machines have been moving (in the stores local to me)
SNES and Sega don't seem to be too far apart, and at the time SF2 came
out on cartridge, I know for a fact SNES was selling more systems.

Incidentally, Greg, I've noticed you get insulting when you're losing
an argument. Don't get your blood pressure up... I probably shouldn't
kid you so much about being a rabid Amiga advocate. So calm down, and
don't take things so seriously, ok? :)

Actually, Greg, you've come out from the moment the specs were posted
and made nothing but accusations that the Jag:

- lacks a 64-bit buss
- is run by a 16-bit CPU (68000)

and both claims were either refuted or unproven.

>
>But is this the general case, one asks? Yes, it can do some tasks

Most kids I know (and some of them are older than me :) ) think that
both systems are nice... a lot of them like the SNES fighting games (an
area where the Genesis falls short right now), and like the more colorful
SNES versions of most games that are available on both. However, even though
I personally think the hardware on the SNES is beter, the Genesis has some
titles (definitely Madden '93) which are better than their SNES counterparts
(usually because they are just programmed better :) take a look at
Sonic 2).

: This is one point I'm not sure you're correct on. I'm not going to start

The article I read on it, somewhere, was last month.

Besides, I know a lot of people waiting for Mortal Combat, and I DON'T
mean the g-rated SNES version.

Nothing like ripping out someone's spine to make one feel all queasy
inside.

: Incidentally, Greg, I've noticed you get insulting when you're losing
: an argument. Don't get your blood pressure up... I probably shouldn't

Nah, I just get really ticked at certain kinds of comments.

:

I get emotional over hardware. It's just me. Pay no attention. Think
of it as a fetish... :)

: Actually, Greg, you've come out from the moment the specs were posted
: and made nothing but accusations that the Jag:

Oh, they're DEFINITELY just sidethoughts, there's nothing substantial
about them.

: - lacks a 64-bit buss

This from the mb/s rating they gave; you've got an answer, and the job is
to figure out the question, given a few variables. I tried to work
backwards.

: - is run by a 16-bit CPU (68000)

That's the way their own press release makes it sound.

: and both claims were either refuted or unproven.

: Most kids I know (and some of them are older than me :) ) think that
: both systems are nice... a lot of them like the SNES fighting games (an
: area where the Genesis falls short right now), and like the more colorful

Only for now. Hell, _I'M_ considering buying a Genesis to get Mortal
Combat.

: (usually because they are just programmed better :) take a look at
: Sonic 2).

Definitely. ;)

Depending on where you live, it's imaginary. :)

: Doesn't everyone love how Greg changed the topic to the Falcon's 16-bit
: bus (a known fact) when he gets chastised for bashing the 64-bit Jaguar
: and gets the facts (with a block diagram, no less) thrown in his face?

"chastised" is proper. And excuse me if I'm just a little too wary to
believe their press release, I do remember where it got me with the
Falcon one.

I took the Falcon's tech sheet as gospel. My mistake. Fool me once,
shame on you. This time, I'm not taking ANYTHING they say as true until
it's proven. Just like those faulty "MIPS" numbers and the whole 107mb/s
issue would lead me to believe. If I took it at face value, I'd be where
I was with the falcon. This time, I know they're fudging. And I'll be
damned if I won't look for it.

And that block diagram was included with that press release, and no
different than we've seen in EE times. And I'll tell you how much faith
I put in THAT. Yes, it describes things in a very broad and general
fashion, but it's broad enough where they could get away with doing some
pretty underhanded things.

Ok....you Amiga people seem to have less faith in your own CD32 wannabe game system than everybody else! THEN, you go on to try to make the Jag look bad... funny....I haven't seen any mention of ANY 64-bit stuff on the CD32....Ok, you guys just need to face up to the facts--the Jaguar iswesome...there's no denying it...even if any of you guy's stupid little arguments were valid... please name any game system that's even been mentioned as a small, little, thought (now I'm including vaporware in on this too...) that even matches the Jaguar's specs...don't forget, the Jag has been in development for over 3 years...I heard a brief mention about the CD32 the other day...

Oh yeah...the 3DO kicks CD32's butt anyday! (I'd like to see screen shots for the Commode...)

I would hardly call the 68000 in the Jaguar the "CPU". That's like
calling the 8MHz clock in an ST the "CPU" just because it drives
everything else. Look at the block diagram again and you will see that
the CENTRAL PROCESSING UNIT in the Jag is TOM, not the dinky little
68000 hanging off 0.25 of the bus.

Here again is my ASCII version of the block diagram posted with
aeo_se_j.zip to atari.archive.umich.edu:

>Sure, fine, yeah, cool... Except they didn't actually *say* 16/32 anywhere,
>did they?

Nowhere in the advertising for the Atari ST does it state that the
keyboard controller is an 8 bit chip, either.

Just because it's a general purpose chip, doesn't mean the 68000 in
the Jag is the heart of the system.

The task of the 68000 will simply be to pull a few strings and leave
the rest to the subcomponents of TOM and JERRY. Indeed, the 68000 goes
through the memory controller in TOM to the memory. Amiga owners of
all people should understand that even with a slow processor calling
the shots, if your graphics hardware is up to scratch, your options are
unlimited.

I haven't got the Nintendo/SGI info on hand, but you don't think they're
going to use the *CPU* out of the SGI machines do you!

## 1354. Jaguar QUOTES:

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-01 05:07:05 UTC
From: warwick@cs.uq.oz.au
Message-ID: <15189@uqcspe.cs.uq.oz.au>
Source record: 21838

We see a lot of "so-and-so said such-and-such" in this group - accompanied by allegations that people have lied, etc., so I have clipped all references to "64" in regard to the Jaguar in all the AEO online magazines from aeo_0208 (April) to aeo_0214 (August). You will see how it is the listeners' ears, not the speakers mouths that have "lied". Here they are.

aeo_0209, aeo_0208, aeo_0210:
none.

aeo_0211:

<ZNET>
The Jaguar comes with two megabytes of RAM, a 64 bit custom RISC processor, and a full 64 bit bus.

aeo_0212:

<ZNET>
IBM to manufacture the Atari Jaguar, Atari's 64-bit multimedia entertainment system.

<ZNET>
Atari announced plans for the Jaguar on June 3. The game player will be based on an Atari-designed 64-bit processor and a sound system based on Atari's digital signal processor.

<Dateline: Atari!> <[Host] ST.LOU>
Tonight Bob will bring us up to date on the industry-setting news about the Jaguar - Atari's 64-bit game console

<BOB-BRODIE>
Especially of interest to some of the attendees at the [shareholders] meeting was the fact that the Jaguar does in fact have a 64 bit data bus.

aeo_0213:

<ZNET>
The long-anticipated Atari Jaguar, to be introduced in the New York market later this fall, is a 64-bit interactive multimedia entertainment system with high-performance, true color and CD-quality sound.

aeo_0214:

<[Hassen] H.HAMMOUD>
will Atari plan to use their 64 bit RISC chip in any

computers...perhaps as an add on board for the Falcon's
processor slot?
<BOB-BRODIE>
Re the 64 bit RISC chip in the Jaguar, we are reviewing all of
the options for using this chipset, including computers.

<[fugitive] E.LIN1> Could you list all the chips that will be in
the Jag? Will it have a 64 bit graphics processor only or will it
be a true 64 bit machine?

<BOB-BRODIE> I could, but then Sam would kill me. Unless Leonard
got to me first. I can handle Richard Miller, though. :)
Seriously, it is a true 64 bit machine, including a 64 bit bus.
Later on this month, we'll be releasing more press materials on
the Jaguar, I'm certain that they will also have that informatin
in AEO.

<Electronic Engineering Times>
Atari Corp. will score a new level of video-game performance
this fall with the introduction of Jaguar, a 64-bit RISC-based
system offering real-time 3-D shaded surfaces with texture
mapping...
Jaguar, billed as an interactive multimedia system, is based on
an Atari-designed proprietary 64-bit RISC processor and its
proprietary digital signal processors. The cartridge-based
system features 24-bit true color graphics, shaded 3-D polygons
and real-time texture mapping.
Jaguar's core consists of two chip sets, one holding the 64-bit RISC
processor and the other containing DSP hardware.
The 64-bit RISC processor is capable of processing video data at a
high rate, handling various video effects as well as full-motion video
compression on its own, Miller claimed.
[Miller says:]
"Graphics eats a lot of bus bandwidth. What's available today
for other 64-bit processors such as PowerPC is only just enough
for what we want to do, What we designed is right up on the
level of expensive 64-bit processors."

Clearly, manufacturing volume is essential to the Jaguar plan. The
company intends to introduce an add-on PC card featuring the company's
proprietary 64-bit RISC processor, said Tramiel. "It could also help
minimize the cost of our chip sets," he said.

---

NO-WHERE does it even say "CPU". Always the 64-bit RISC chip is
referred to as a "processor".

Fine. That would imply running a 37ns page mode cycle. I don't have any
datasheets handy, but I believe 60ns DRAMs generally have a 30-40ns
page-mode cycle time, which you can _approach_ if you have a very slick
DRAM controller. There's nothing in these figures that leads me to
doubt that Atari is using a 64-bit bus. Even the much-maligned
Falcon uses a 64-bit memory bus.

Ok, I know what you mean. But it's an abuse of the RISC term as it is
used today.

>just controlling the ComLynx ports and stuff like that.

On the 68000:
---
I can think of one or two things that the 68000 could be used for. If they haven't built in some form of sprite collision detection in hardware (a distinct possibility, since I have seen no mention of any such capability) then the 68000 could be used for software sprite collision detection.

This would put it in line with the SNES which uses it's "processor" (and I use the term loosely :-)) to do the sprite collisions. However, where the SNES's processor is woefully underpowered for this task, (and is probably responsible for some reported problems when things get busy i.e. the graphics slow down), a ~13 MHz 68000 has ample power for this sort of task, and you don't need to move that much data around to do the collision detection at all. Collisions can be calculated against a 1 plane data mask of the background and sprites (at least this is how myself and a friend are doing it in a game we are producing), and such a mask does not require much data to be moved in and out of the processor - well within the bus bandwidth of a 68000 on a 16 bit bus. This would all be in line with the reported architectural details posted here and elsewhere.
If you have the capability in one of your graphics processors to do fast 3D calculations and rendering, the 68000 is totally superfluous in most 3D games, which is where the Jag could really shine.

I think the 68000 and its 16 bit bus is being blown out of proportion here very considerably, and I don't think it will be an impediment to the Jag's performance in any way, although I guess we'll have to wait and see. I am much more interested in finding out more about the capabilities of the custom processors, as this is where the Jag will sink or swim, not on it's GPU

which is, as I said, largely superfluous.
Anyone who has programmed on an arcade style game will tell you that shifting graphics is usually the major problem - actually keeping a game going is chicken feed in terms of processor time. If you have custom hardware to move your graphics, then a 13 MHz 68000 on a sixteen bit data bus can keep all game tasks going, and probably have time left to sit back, make a cup of coffee and relax for a few milliseconds while waiting for its next VBL :-).

On the 64 bit question:
---
If Atari want to call the Jag a 64 bit console, then it's difficult to say if they're being honest or not. From the circuit block diagram that I have seen in Atari Explorer Online, _all_ the speed critical system components are on 64 bit data paths. The quoted bus bandwidth is definitely generous, and in line with what I would expect for a 64 bit data path (optimal figures, of course...). Most of the system operates on 64 bit data, so they're probably safe - for instance, what is the legal definition of a 64 bit console? Is there one?

I _would_ like to know if the Jag has hardware sprite collision detection though, 'cause if it does it would blow this current pet theory of mine as to the 68000 tasks clean out of the water...

Anybody know the answer to this one?
8-)

I have tried my best to explain why _I_ think the 68000 is not a problem. All things that I have stated are opinion and conjecture only, I do not claim to speak from facts, but have based my statements on my own experience. Everything is IMO. I make no claims about the Jag relative to the 3DO, which I know little about, or the CD32.

Cheers

- Andy. < The Man From U.M.I.S.T. >
(Before anyone wonders, I am an ST & Falcon owner, but I personally have nothing against the Amiga _at all_ and would buy one on the spot if I had the spare cash. I would also like an Archimedes, a NeXT workstation, a Sparc 10, a ... <grin>)

I *really* question this statement. Greg, I follow the console market very
closely, as I have both an SNES and a Genesis, and pretty much every source of
sales figures I've seen (electronic gaming monthly, et al) indicates the SNES
is selling as well or (as most indicate) better than the Genesis now that it
has a reasonable software base. I don't understand where your getting
your sales figures from... did Sega say this?

Well, we all know what kind of a rep Atari has for marketing (vote: Is
Atari's marketing worse or better than Commodore's, or do you think
they're both practically non-existant?)

Ah, and the jury is still out on the 64 bits. Apparently, the DSP only has
a 32-bit path to memory, and the CPU only has a 16-bit path to memory.

> Oh yeah...the 3DO kicks CD32's butt anyday! (I'd like to see screen shots for
> the Commode...)

Yeah; unfortunately, it's gonna be about twice as expensive... Remember how
the C64 got so popular when it was (in many ways) inferior to the 8-bit
Ataris? C= slashed prices, and people bought. When you get down to it,
it don't matter how many gouraud shaded polygons you can render every
second... It's PRICE that counts. Why d'ya think there are still people
buying NES and Master Systems?

I notice you don't say anything about the 3DO kicking the Jaguar's butt...
Why not, pray?

Maybe because Warner used to own Atari (in the original video game boom, I believe Atari was a *huge* moneymaker for Warner) and I think still has a decent amount of stock in Atari (correct me if I'm wrong, which I'm sure someone will do :-) Hmm, ever see the movie "Blade Runner"? Couple of Atari fujis appearing in there too :-O

If that were so, then perhaps you'd be right. It ain't so, so you're
probably wrong.

>EVERYONE STOP DOING SYSTEM ANALYSIS ON A VIDEO GAME CONSOLE WHEN YOU DO NOT
>KNOW THE DESIGN REQUIREMENTS!

What makes you assume that I don't know the design requirements? I've
designed video games, bubba. I was a hardware design engineer for
nearly a decade, working on systems a damned sight more complex than
the Jaguar. I think there's a reasonable chance that I *do*, in fact,
have a pretty good grasp of the design requirements. And I'll tell
you this, straight out: the specs for the Jaguar, as published, don't
make sense.

>What SOME PEOPLE are still missing is that the 68000 will not have to do the
>major part of the work, graphic rendering. There is another whole chipset for
>that. And if you do not think that rendering is where the majority of your
>time will be spent, then try writing a busy animation that uses a 320x200 area
>and send a character out the serial port after every frame. The results will
>astound you, even if you choose a monochrome display.

But you make a very bad assumption here. The fact that in a graphics-intensive
game, most of the processing time is spent rendering graphics is no secret -
that's the reason for having a graphics co-processor in the first place.
But that does *not* mean that the 68000 is, therefore, less "important"
than the graphics co-processor. In point of fact, it's possibly even
*more* important if the graphics tasks are offloaded, since that gives it
the capability of doing more computation and setup work, which is crucial
to the graphics operating efficiently. The bullshit about how the 68000
is "just an auxiliary processor" is simply that - bullshit. By all
indications, it is the graphics processors which are the "auxiliary"
processors, and just because they happen to run faster than the 68000
(but what would be the point if they did not?) does not magically
promote them to supervisory status. And just because Sam Tramiel says
it's so does *not* make it so.

Here's a little hint for you all: Guess what proportion of the *code* of
a game is taken up by graphics processing? Answer: very little. Graphics

tasks tend to be highly repetitive, so they *will* take up a lot of processing *time*. But the rest of the code is significant, too, and has a great deal to do with the playability of any given game. Hot-shot graphics, in and of themselves, do not a game make.

Maybe you could do everybody a service and post something that officially tags the 68000 as the CPU. I pored through several files worth of Jaguar specs and found nothing that explicity states the 68000 is the CPU. The closest I could come was a mention of the 68000 as a "general purpose control processor." In fact, in the Dephi conference with ... um ... somebody, it was explicity stated that the 68000 was NOT the CPU, but that the chip called TOM (which includes the DRAM memory controller, object processor, GPU and blitter) is the CPU.

Here ya go:

y MC68000 CPU clocked at 13.3 MHz as a general purpose control
processor.

> and found nothing that explicity states the 68000 is the CPU. The closest I
> could come was a mention of the 68000 as a "general purpose control processor."

Sounds suspiciously like the above line. Strange that you missed the
"CPU" part... Oh yeah, this is ripped from a technical document someone
(thanks :) mailed me.

Well, that sounds like good ol' Agnus to me... DMA control, blitter and
copper. Ain't nobody never called Agnus no CPU.

I'm not convinced that referring to the chip as a "MC68000 CPU" makes it
the Jaguar's CPU. Considering what the chip is generally used and designed for
I think it's very possible that "MC68000 CPU" is its NAME (or designation)
rather than its FUNCTION (in the Jaguar).

Uhm... Can YOU tell me what's so fantastic about `64-bit' ?? Does it
make games better? More playable? I can do "64-bit stuff" on the CD32 anyday:

```
add.l d2,d0
addx.l d3,d1
```

Voila! A 64-bit integer addition. I bet our games will sell tons and I will
make billions on royalties when we tell people about this. I mean, WOW! We
use "64-bit stuff"!!

3D0 is also way overpriced. There's just no way a 700 dollar machine is going
to sell well. It's much too expensive. We have been approached by both 3D0 and
Atari for Jaguar and 3D0 development, but decided to wait and see if they take
off before we do anything. But we plan to release almost all our forthcoming
games for the CD32.

I`ve said it before and I`ll say it again....

Why do you Atari types keep arguing specs with the rest of us when AFAIK no really solid official details of the Jaguar have been released?? Sure, there are a few posted block diagrams here and there, but has the machine even been built in prototype form yet? Have people seen it running? Have software developers started coding for it???

Until we see the Jaguar for sale, it`s pointless to try to bash CD32 - CD32 is here NOW, the Jaguar *may be* here in a year or so`s time.

If tech specs counted for anything, the Lynx (which I own) would be the #1 handheld - but it isnt and never will be. And it actually has been around for a couple of years now. I think you are barking up the wrong tree if you expect some as yet unexistant console to save Atari.

I suppose after the Falcon disaster you need a `next big thing` to give you hope...

Gavan

Just because they do not make sense to you doesn't mean they don't make sense,
it just means that you MAY NOT have enough information. I did not make any
assumptions about about anyones background. I spent 10 years designing
hardware, and writing micro-code and device drivers for military graphic
displays. (For my last project look at the 6 cockpit displays in the F-22)
And while I have questions about the specs and block diagrams I have seen,
but I will not jump to conclusions about how the system is intended to
function. Until I can get my hands on one for a little creative analysis
I'll with-hold any statements.

Yep graphics will end up being a very small amount of code. But you are also
making assumptions about the use of the 68000. You BELIEVE, but do not KNOW,
what the 68000 will be used for, and I actually agree with your belief. But
it is still a belief, unitl we can hook on upto a logic analyzer and In-Circuit
Emulator :)

>just not as fast as we'd like.

I used to have dreams of one 32bit blitter per bitplane, clocked at
28 or 56MHz. That would be a smokin' machine...

>And you know very well that CD^32 has 32-bit CPU, RAM, ROM and chipset
>access. Despite the *internals* of the chipset, the architecture is very
>much 32-bit.

And you know very well that if any other company claims 32 bits or
64 bits, people here will point out that certain parts are not fully
32 bit or 64 bit. Nitpicking will come back to haunt many of the
regular posters in this newsgroup.

>Supply and demand. Supply is very limited, unable to meet demand, therefore
>there is no market incentive to reduce the price. We've discussed this - I
>don't claim the situation is a good one. I'm just explaining why it is that
>the price is high.

What is the problem with the supply end? Is there some magical part
in the A4000 that can only be manufactured on shuttle missions? The
040 is standard, the RAM is standard, the HD is standard, and the
custom chips come from established chip-fab houses. Is the case
carved from a single ugly piece of plastic or something, perhaps by
the 4 remaining members of a South American tribe? I'm sorry that I
sound so sarcastic, but I cannot see anything about the A4000 that
would make it such a bitch to produce.

>How is the A4000 "crippled"? As in, CPU on 16-bit bus, or polled SCSI, or
>slow expansion bus? The memory design doesn't let the '040 run at full speed.
>I'll give you that as "crippled". Was that what you were talking about?
>And remember that there's a lot more to architecture than the graphics chipset.

Yes, that was the main point. When I found out that it couldn't even
keep up with a 68030-based A3000 when going to memory, I was more than
a bit pissed off. The IDE I could live with, especially given the
lack of a CDROM that was CDTV compatible. The 1/2 speed floppy hack
was not so bad as I don't use floppies most of the time. But, the
crippled SuperBuster chip fiasco burned me up, and I'd probably still
be fuming about it had I kept the machine.

>Heaven help us if that's true. The neat thing about 3DO and Jaguar is that
>they're designed from the ground up - no kludges to be seen. The last thing
>I want to see is more bits hacked together in a x86 box. "VGA-TV boards",
>indeed!

I was being a bit sarcastic there. However, it wouldn't surprise me
if some company did try such a thing. The Tandy VIS could be
considered an attempt, but it didn't have the necessary horsepower.

>Surely you jest, sir. No, it's not a miracle chip. But, I find it ironic
>that, just as there was lots of discussion here about chunky vs planar, and
>how the Amiga can't do some things well because of the planar architecture,
>Commodore surprise us by addressing the issue with (part of) a dedicated
>chip. But, was there a single good word to be said about this? No, all
>there is is "CD^32 is all very well and good, but it will never sell anyway".
>I don't know... :-(

From what I gather, the Akiko chip converts from chunky to planar, but
no one has said whether or not it actually speeds up the planar
graphics. I somehow doubt that this is the case, but perhaps I will
be pleasantly surprised. The reaction might have been better had
Commodore announced plans to retrofit AGA machines with the chip
and include it on current models. It looks like there will be some
sort of add-on for the A1200, but they say that the A4000 version
will be later, if at all. What kind of policy is that? That's the
same sort of thing they did with the CDTV and A570, supporting the
very lowest end machines while neglecting the high end. I swear, I
wish I knew what sort of logic is behind their decisions.

: > y MC68000 CPU clocked at 13.3 MHz as a general purpose control
: > processor.

: I'm not convinced that referring to the chip as a "MC68000 CPU" makes it
: the Jaguar's CPU. Considering what the chip is generally used and designed for
: I think it's very possible that "MC68000 CPU" is its NAME (or designation)
: rather than its FUNCTION (in the Jaguar).

Function: General Purpose Control Processor.

"Control Processor" designates some kind of supervisory control over the
system. Which places it at the center of the system, offloading work
onto the other processors/coprocessors.

"General Purpose" designates a design--it's designed to be the chip to
use when a task falls outside of the work of the specialized coprocessors
in the system.

In other words, that line DOES say that the 68000 is the heart of the
system, even if it's a heart with some helpers that are more powerful
than it.

I thought the the Falcon was a myth? Any figures on numbers sold? I suspect
that a number of Falcon owners may indeed have regrets. How many software
titles have shown up for the Falcon. If I have misconstrued reality, I'm sure you'll
enlighten me but I suspect regardless of Falcon's capabilities, it could be very tiring
having to do roll-your-own software every time you wanted to do something on the
machine. OTOH, even though Gregory tends to judge systems solely on their
technical factors, I still respect his grasp of that aspect of things. What's the
real story, compadre?

Ok, first of all, the "64 bit stuff" I was referring to was HARDWARE, not a
silly little assembly trick. What I was merely trying to say was that you guys
are calling the Jag vaporware, or inferior to the CD32, and you are not only
misleading the poor innocent consumer who happens to glance upon the comp.sys.
atari.advocacy group (BTW, it's still beyond me why you Amiga guys hang out here...ya'll
must not have anything better to do with your time...), but you are
only misleading yourselves. Ok, I'll give you the one about Atari being the
slightest bit misleading in their press releases, but to go off and say that
just about everything they say is a lie is showing your close-mindedness.
Open up and just admit, the Jaguar is gonna be one hell of a game machine.
Oh, BTW, don't know how many of you saw that bit in the S.F. Chronicle about
the Jag, but the article stated that Atari was running against Nintendo, Sega,
3DO (which, BTW, is NOT superior to the Jag...but good nonetheless...), but
nothing about the Commode...Oh yeah, one more thing...for you guys who claim
that NO-ONE has seen any demos of the Jag, go have a chat with Andy Eddy...or
all the Atari shareholders who showed up for the meeting...

Certainly, but the real question is, how did T-W come to own part of
Atari? Some are saying that they have always been a player, others are
saying that they sold out their ownership and have now re-invested in the
above mentioned 20%.

Yes, but as we've seen in the past with the Lynx, even Atari can take a
technically superior system and murder it by not licensing any 3rd
parties...

Well, at this point Greg, I have to publicly call for your calculations.

You've told us you've done them multiple times, so now is the time to show
them to everyone so we can point out what you've done wrong, or where your
calculations could easily admit a 64-bit model.

Now Greg, we find out if you have any real confidence in your supposed
calculations.

No, the Falcon isn't a myth. The Falcon started shipping in March.
I have no idea how many have been sold (believe it or not) but I've noticed
that local music stores are once again carrying Atari product, which is
good news after a few years of watching the number of dealers decline.

Well, as I have no Falcon (yet), I guess I can't say much about. I think
people buy the Falcon as: 1) a tool for music, or 2) a cheap fast ST.
(personally, i think it excels more as #1 than #2, because TT's are faster
and roughly in the same price range)

That's true. But both Atari and Commodore are known for bringing technically superior machines to market (relative to the DOS world) and lettin them die for lack of effort in the area of promotion or encourating 3rd party support.

:
: No. 107 mega-bytes/sec through a 64 bit bus.

Is this measured by clearing all the DRAM bits to 0?

: > The MIPS figure sounds awfully fast, fast
: >enough for Atari to sell the risc chip to others as a cpu. Then
: >again, I guess the MIPS figure is just adding the 68000 (all 2 mips of
: >it), to the risc chip and the dsp..
:
: Atari had no plans to sell the RISC processor. It is fairly
: specialized. Probably does not support a lot of Virtual Machine aspects
: and things like that.

Still didn't answer the questions posed:

o What is the main cpu?
If it's not the 68000, then how many programmers are competent
enough to know risc machine language?
There is no operating system, which implies that you WILL have
to bang the hardware and tweak registers.
Apart from Gregg Giles and Stefan Boberg, I doubt if anyone
hear can tell us how first-hand how cross development works.

o How is the game engine code going to be executed? From the
32bit ROM cartidge?
Unless the game engine is copied from ROM to RAM, then the
64 bit risc cpu is going to suffer some loss going to the
32bit ROM?

o Also, that 2MB of memory is most likely going to be used for the
video display, as 32bits*xxx*yyy max resolution is going to
take up a lot of your memory and you can't change ROM's, so
only static images will be stored there.

o I would also guess whatever RAM is left over is going to be
used to store variables. If the game code is copied from ROM to
RAM, then memory would get very tight.

o Atari have not used the term CPU anywhere. They have used
the term "processor" liberally. What makes you think that the

risc chip is the cpu and will execute the game engine?.

o Is the 55 MIPS value valid? If it is measuring all the processors
and adding up their respective MIPS ratings, then this implies
that they work in parallel on the same problem? Yes or no?

o Atari have used the term "multi-processing", which is different
from parallel-processing, the only case that I know of that adding
up the various processor's MIPS rating is valid.

: >PS. Apart from Economics and a bit of Civil Engineering, I know
: >nothing, so any compuuter-techno stuff is probably wrong ;-)
:
: Yes. I guess I didn't need to reply!

But you didn't give any evidence to the contrary, or anything to
support your argument. I have used Economics to tell a "story",
or hypotheisis based on logical arguments. Being a CS or EE and
just saying, "nah, I've got a degree, you're wrong, I'm right"
isn't very impressive. Prove me wrong! Came up with a logical
argument why I am wrong.

- Jim

PS. I haven't said that the Jaguar is going to be slow, only that
saying the risc chip is the cpu and the 68000 is an auxillary chip
is extremely suspect.

Obviously, you're not going to be playing computationally intensive
strategy or chess games on it, so the main processor isn't going to
be a big factor. This machine will probably excell at displaying
flashy games. I'd suspect programmers will exploit the strengths and
work around the limitations.

>use "64-bit stuff"!!

You've got to be joking. Can you truly be so ignorant? A 64 bit architecture means that you can perform single 64-bit operations in a single instruction. In your example, you need 2 instructions and 4 32-bit registers. On a 64-bit machine that would be 1 instruction and 2 64-bit registers, and on a RISC machine it would all execute in 1 cycle. Your example can take up to 8 cycles depending on the specific member of the 680x0 family you're using. It doesn't take much gray-matter to realize that you're talking about much greater compute power here. But even then, the full impact isn't realized until you examine the interface between the processor and the memory. Again, with a single-cycle RISC architecture, it only takes 1 cycle to read or write 64 bits from or to memory. On a 32-bit 680x0 that's a minimum of 4 cycles, assuming 0 wait-states and burst mode. Once again, the difference in capability is tremendous.

Yes, a great deal of what's been revealed so far has been just hype. But, there's also a lot of substantial points raised. The 64-bit processor and 64-bit bus are really truly empowering features of the system, just as the 16-bit processor-memory bus in the Falcon is a truly limiting feature of that system.

I don't see why a high-level language with a large library of routines for
the RISC processor couldn't do the same job.

Considering many of the designs possible for a RISC processor, you can
places the burden on, say, the C compiler to make the assembler code
nice.

Come to think of it, does anyone really do Assembler on RISC machines?

(yes, i know it is possible, but it seems to me that the only people who
should would be compiler writers, because they would know how to do things
like affect instruction ordering for maximum performance, and i can't see
the advantage in tweaking too much RISC code if the compilers are good...
but then i'm assuming the compilers exist and ARE good. :) )

And of course it won't have a "true" operating system in the sense of a
computer, but it must have something...

Simple, C= have NO logic! They really dont have a clue about how
to sell computers. They seem to have a few smart tech. people making
the hardware and a lot of executive idiots crippling it or
marketing it incorrectly.

Akiko SHOULD be available for all AGA chipset machines (its
emergence effectively makes the standard AGA set outdated) as a
retrofit *NOW* and all future A1200s/A4000s should have it built in
*AS STANDARD*. However, C= being so clueless wont do this.

I suppose eventually, if CD32 is a flop, they will make an
expansion module available like they did with the A570 for the A500.
Just when no-one will want it..... What a bunch of hopeless wankers!

BTW. I heard a rumour that the chip RAM system in the A4000 is
actually slower than the chipram in the A1200 - ie an A1200 with
25MHz 030 should be able to blast more data to chip thab say, an
A4000/030. Anyone know if this is true?

Apparently, 2 completely different teams designed the 4000 and
1200 and the 1200 was done by the team who actually knew the Amiga
with the 4000 being done by a generic team of designers.

Gavan.

## 1392. the Falcon **FLOP**

Newsgroup: comp.sys.atari.advocacy

>Prototypes: YES.
>Running: YES.
>Developers: YES.

Well, I stand corrected. So can anyone one the group who has SEEN
and USED the machine please give us the facts? There seems to be an
awful lot of speculation by desperate Atari owners who are just
arguing from the press releases.

>Incidentally, I've heard a rumor (and that's all it is until it is
>substantiated) that Mortal Kombat is being planned for the Jaguar. Can
>anyone here verify or refute this?

Its being developed for the CD32 and the Amiga ;-)
I doubt if you`ll see it on the Falcon tho`.....
If the Jaguar is a sucess you probably will see it.....

>> Until we see the Jaguar for sale, it`s pointless to try to bash
>>CD32 - CD32 is here NOW, the Jaguar *may be* here in a year or so`s
>>time.
>>
>Hmmm. CD^32 isn't here in my stores.

Thats because it hasnt gone on sale in the US yet. C= being the
dicks that they are dont seem to have a US marketing policy. When I
said its here now, I meant it exists as a finished product. It
should be in the shops in the UK around now. Most of the mail order
people are advertising it and taking advance orders. I think the
official release was 1st Sept but I may be wrong. BTW, when is the
official release of the Jaguar? 1,2 years away.....?

>> I suppose after the Falcon disaster you need a `next big thing`
>>to give you hope...
>>
>What disaster?

The computer that was going to sell 200000 units in the first year
for Atari - now projected to sell <20000. The fact that it was 6
months late. The fact that you still cant get hold of it easily. The
fact that even if you could absolutely noone outside of the

fanatical circle of Atari advocates wants one. The fact that its impact on the home computing market is ***ZERO***

THATS a disaster. Only Atari could do it (well, C= did the same with the CDTV actually. The situation with it is very similar to the Falcon).

Gavan

PS The Atari scene is so dead that its only Amiga advocates having a go at you in this newsgroup thats generating any traffic......

Akiko's speed can be achieved on an 040 easily and on a 020/030
with only fast RAM available. So, you can emulate akiko on an 040 easily
and on machines with 020+ and fast RAM.

> I suppose eventually, if CD32 is a flop, they will make an
>expansion module available like they did with the A570 for the A500.
>Just when no-one will want it..... What a bunch of hopeless wankers!

570 was designed about the same time as the CDTV. It was released
much earlier in Europe than the US, something like over a year.

> Apparently, 2 completely different teams designed the 4000 and
>1200 and the 1200 was done by the team who actually knew the Amiga

Calm down, please! I happen to agree with C= on this one. We all
agree that the CD32 is mainly a game machine, right? Now, if YOU were
to choose which machine to release a CD32 add-on to (if you could not
do both at the same time), which would you choose - the A1200 or the
A4000??? I would choose the A1200. If you don't understand why, then
I'm glad YOU aren't one of the Commodore executives.

> Akiko SHOULD be available for all AGA chipset machines (its
>emergence effectively makes the standard AGA set outdated) as a
>retrofit *NOW* and all future A1200s/A4000s should have it built in
>*AS STANDARD*. However, C= being so clueless wont do this.

Why?? What do you think is in Akiko anyway?? It's no fantastic
piece of magic, and the only part of it that would possibly be of
any use in an A1200 or an A4000 is the chunky<->planar conversion
logic. I don't quite see how this makes the AA chipset outdated?

Also, what use would it be if all FUTURE A1200/A4000 machines
would have this magic chip fitted as standard?? People wouldn't
be able to do things which rely on it being present anyway, since
the machines sold to date (several hundred thousand), wouldn't
have it!

> Apparently, 2 completely different teams designed the 4000 and
>1200 and the 1200 was done by the team who actually knew the Amiga
>with the 4000 being done by a generic team of designers.

Nonsense. There were two different "teams" alright, but both
"knew the Amiga" well. You can't really expect someone who doesn't
"know the Amiga" to design one, can you?

Well, when I get one, it probably won't help me argue about the hardware inside. I won't be opening the damn thing up. Therefore, the spec sheet would seem to suffice. Where do the CD^32 specs come from?

> Thats because it hasnt gone on sale in the US yet. C= being the

Yep, the Atari scene that has Nintendo running to SGI and 3DO badmouthing the Jaguar, saying the Jaguar is Beta to 3DO's VHS, is really dead. Yep.

Tom

Good--so we agree that hardware specs don't mean squat. Let's wait
and see if any of these new "power" game systems are any fun. One
item of interest I noted for the CD32 was "Mortal Combat". They better
not remove the lovely blood-spilling, head-ripping, heart-tearing,
flesh-burning parts! :^)

> WHEN! (no flame or irony, curious).

I think you are asking when I played on a Jaguar. Anyhow . . .

They had one (not in a production case) at the stock holders meeting.

It was fairly nice. BUT, although it would be nice if Atari sold a successful product (i.e. the news of the Jaguar has driven the stock price up, but I bought it about 6 years ago for about $7, so it would be nice if it got up to that again! At one point it was at $14, but I neglected to sell it!), I am not going to be foolish enough to think it will survive until I see Atari do some better than (their) usual marketing.

Furthermore, I had never even heard of a CD^32. (So maybe Amiga needs to advertise as well). But I would certainly consoider all options if I were to buy a game machine for myself. I think the Jaguar will be better that the 3D0 because of its additional power and much lower price. I KNOW it will be better than SNES and all that garbage out now. (My games from 1985 on my ST are in fact generally a fair amount better than SNES games).

Ack! Why all this resposne for a simple question? (WHEN did I play a Jaguar). Sorry! Just rambling. (Trying to say that I am going to check out some of the other offering before I go buy a Jaguar, although I think I may buy one in November if (1) I can find one and (2) nothing better is out.

I am sure you are right. (I have enough faith not to get out a
calculator). My point is that there is FOR SURE a 64 bit data bus
between the major components. (See the graph). Obviously comminications
with the 68000 is 16 bit. But I am not going to pretend to know exactly
what they are using the 68000 for.

You may be able to get 107MB/sec through a 16 bit bus. Hell maybe even
an 8 bit bit with advanced technology. My points were: (a) there IS a
64 bit data bus to all components that are capable of it, and (b) it is
fairly fast. 107MB/sec is a good rate for a game machine.

# 1402. Last Post !

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-02 16:38:17 UTC
From: mcookson@flute.calpoly.edu
Message-ID: <1993Sep02.163817.146330@zeus.calpoly.edu>
Source record: 21881

This will be my last post on the Jaguar topic. (Unless I see a major new direction in the threads of stuff that hasn't been beaten over the had to death).

Ultimately, what is going to matter to the success of 3D0, Jag, and CD^32 is how good they are to play games on. I don't give a damn how advanced or simple the games are. The Nintendo has crummy graphics and sound and . . . (fill in your own here) . . But, the games are very playable, and that gained it the Lions share of the market.

My Atari ST has better games that a SNES. But, they take more effort to play, and there are extra hassles (like unplugging a mouse to plug in a joystick). The games are great for computer users. But the user interaction before the game is not good enough to be in the same category as the Nintento, et al. (Dedicated game machine).

The acid test for the Jag and these other machines is going to be putting a 6 or 7 year old kid in front of it, giving him a few cartridges, and seeing how long he is willing to play it before he decides to go back to his NES or SNES. If the overall game quality is better (i.e. the kid decides to play on the Jag/CD32/etc), then the thing will succeed with the correct marketing. PERIOD.

The other stuff is of more interest to us, but not the game playing world. The "Nintendo" generation (Generation X.1, generation 13.5 whatever you want to call it) (i.e. not us, 16-25, but those 6-16) doesn't care if a machine is designed well interally. They care more about the nomenclature ("32 bit", "330 MB (bit of course)", etc).

I care about the power of the machine. I care if the bus is 64 or 32 bits, what the CPU is, etc. But these are not what is going to make it successful.

PART II. Architecture, etc.
---

With that in mind, a few things on things WE care about (even though it is not in the least bit going to effect the success of these machines). PHYSICALLY, the Jag. seems to be well designed. It is hard to tell with the mix of BS, Rumor, and Fact out here. BUT, if that block diagram is correct as a high-level diagram: The Jaguar is not crippled by Atari's usual BS (16 bit bus on an 030, etc). I think that even Greg (you reading this) should agree that as that picture shows, the design is fairly good. It seems fairly obvious from that that the "Tom" chip is doing the grunt of the work. (There was also a post by someone claiming that the Jag specs just didn't make sense and that he

was a game designer, and therefore better than us (okay that was paraphrased). He seems to be one of those close minded individuals who takes every chance to increase the amount of BS floating around.)

Who knows exactly how Atari has designed the system in regards to what is processing what. That could make a fairly big difference. Until then, at least the Specs and Block Diagram look very impressive.

The color and sound are very good. But they are going to be lost on the TV. So who knows how that will effect the Jag. (I.e. having 640x480 may be a handicap for those who don't buy a monitor to use with the Jag (I don't even know if this is possible, except a composit monitor which wouldnt be any better. I hope some good quality monitor could be connected). If the games are designed for 640x480, but everyone uses a TV, it could be hard to read the text, and so on.

The sound should be more on the level of a good IBM sound card that the garbage that comes out of a SNES/etc. Again, not enough info to discuss.

Point of this part: The Jag has a nice clean design that could be very powerful. Debating what points of the spec sheet Atari is distorting is kind of silly until we know more. But the Jag. doesn't have the obvious (and upsetting) flaws seen in some other machines. (I.e. although I may buy a FALCON, I am disappointed that they use 16 bit memory, when the cost difference is not that significant. RAM access is very important to performance).

PART III - Misc
---

I guess thats about all I have to say. I, as a rule, don't ever expect Atari to succeed (they have lost my trust). I do think they have always made a good machine. Each generation of Atari was better than the big machines. (IBM, Apple). (Until recently. We havent seen an 040 Atari yet. Power PC? who knows). Amigas are similar. Both Atari's and Amigas are great to use for intelligent and demanding people. They have both always had a devoted cult following, which has often meant you could get FREE software for these machines that is better than commercial IBM/Apple software. I now use both Apple and IBM, and for a while left my Atari to collect dust. Buit about two months ago I dount "Mint" (The multi tasking FREE software for the Atari if anyone doesnt know). That once again reminded me how good the Atari is. I could never leave my Mac and IBM now, as they (because of the huge software base) offer things the Atari cant. But i LIKE the Atari better. I am sure I would like an Amiga better. Anyhow, with this 100K file (Mint 1.08) I can do PRE-EMTIVE multitasking on an 8 MHz 68000. On a mac? Nope. System 7s multi-tasking is fairly poor. An Amiga? Of course, as always. An IBM? Nope. Need 8MB and a 486 to do pre-emtive well. But on this old 1978 Motorolla in the 1984 Atari someone did it. It is hardly perfect, but it is very good none the less. (And ridiculously, my Atari often seems faster that my Sun Sparc 1+. Of course, if I try

to compile or nroff somenthing, I see the difference. But the user interaction with tcsh is very good on the Atari. It should be great on a TT or Falcon. (Ok I am getting boring and all together too long and may get hung up by a network fluke so will make this quick).

That was just a (long) example of why I like my Atari. A very simple example at that. Hopefully it got somenthing accross.

CONCLUSION
----------

You are still reading? God. Pretty dedicated. My final point is that all this bickering is not doing much. I fully intend to get an Amiga someday. It is a low priority, as I have several computers and probably (unfortunately) will need to go for a high end MAC or IBM (Mine are outdated. :-( ) because of the tasks I need to do on them.

There are so many people on the net that it is easy to reply to every message (I thing this may be my 5th reply today) and post more stuff everyone else has already said. Lets stop some of the bickering and get good discussion here (as evidence by long messages without a lot of the previous one included? :-) ). Just be openminded. I don't care if you are a die hard Amiga or Atari fan, or a Mac user in to throw in his/her two cents.

Okay. I have reached the point where I can't adequately finish this! (I would keep babbling forever due to my lack of ability to correcty summarize my thoughts! :-) ). Maybe this will spur some good discussion. Probably not (if history is a lesson). Thanks for reading this far.

- mike

Wow, someone at C= actually knows about the 4 P's.

Nice to know that you are signing a lot of third party guys, and I
think your 'p'roduct in CD32 is good. But historically C= has always
had a good product, but screwed the pooch on the other 3 p's. Mostly
promotion and placement. I expect product from you, but if you want to
quell some fear, tell us a few places the CD32 will be placed and
promoted. AmigaWorld+Creative Computers wouldn't sound nearly as good
as Electronic Gaming World + Walmart.

You know, if you add a few other machines to the testing (such as a
Commodore Amiga, a Silicon Graphics workstation, and ... <fill in the
blank> ), you would have an excellent story idea for Byte Magazine!

Anybody want to suggest it to them?

I don't have any ties with Atari, so no I don't have any figures on numbers sold. I don't really know how many software titles are available either, since I did good to buy the thing in the first place and don't have a lot of money to spend on software just yet. Fortunately, almost all of the software I used on the ST also works on the Falcon (only a bit faster and with nice colors). I am not suggesting that it is a killer machine or that it has everything anyone could ever want in a computer (including lots of software support), but I do like the machine and have no regrets in buying it. I also have not seen anyone else here or on GEnie that regretted buying a Falcon. Hey, it's not perfect and there are some minor compliants here and there, but Greg would have us believe that it is a complete dog and anyone who bought it has regretted it - this just isn't so.

Right. I guess the press release was wrong and the IBM factory in NC is
prepping to build these fabulous CD^32 units starting now.

Hmmm. Come to think of it, I think that manufacturing contract for $500 million must be from Commodore, NOT Atari.

And that the prototype shown at the Atari stockholder's meeting and the video tape given out at CES were of... not an Atari product.. no.. but this CD^32!

That's it! The Jaguar is the C= CD^32! Wow!

The CD^32 exists about as much as the Jag does. I've seen no ads for it, no mention in USA video game or computer magazines (and no, i don't read the C= specific rags, so I guess I missed out), and I noticed that on the front page of the latest EGM (in USA, of course) they have this blurb on the COVER about having hot info on the new killer Atari system, and dedicate a whopping 1 page to it. CD^32 of course was prominently featured... NOT.

So, perhaps in Merry Olde England, CD^32 is poised to mop things up, but (ahem!) on this side of the big pond, things are very different.

^
>months late. The fact that you still cant get hold of it easily. The
^^^^^^^^^^^^

I think it was due last November, and I saw a "real" shipment for sale in March of this year. So you're off by a month. :)

>fact that even if you could absolutely noone outside of the
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
>fanatical circle of Atari advocates wants one. The fact that its
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Dead wrong. Get thee to a music store, milady. :)

Really... it may be different over there, or perhaps in other parts of the country, but local to me (which is what matters since i'm not going to go too far to buy a new computer, you know :) ) there has been significant increase in the number of Atari music computer dealers. It had gotten pretty bad until the Falcon came out.

Now, it is nice to once again be able to drive 10 min. or so and get to a Falcon/ST dealer.

>impact on the home computing market is ***ZERO***

That's subjective. :)

> THATS a disaster. Only Atari could do it (well, C= did the same

Just out curiosity, has 3DO actually recognized the Jag as competition and already begun badmouthing it?

If so, the Jag must be a legitimate threat... but 3DO is more than a game machine (and priced like it is more...).

Incidentally, for those who care, Beta was actually a superior format to VHS.

:)

You have a really vivid imagination if you think that Atari have
nintendo and 3DO worried. Atari have failed miserably to beat even a
shit company like Commodore in the home computer market, and now you
want to take on Sega and Nintendo (and possible 3DO) in the console
market!?

puh-lease!

Gavan

>Ummmm... i haven't exactly seen people claiming to have seen and used CD^32
>if that's relevant to the discussion. :)

You dont need to have seen it. Its just an A1200 with a double speed
CDROM drive. I know a few people who work for Amiga mags that *HAVE*
them in their offices. It goes on sale here in 8 days.
The jag, although potentially very good, is brand new, untested
technology in the developement stage. Thats why you need to see it
to get an idea of its capabilities. Its pretty easy to see the
capabilities of the CD32 if you know the Amiga 1200.

>And that the prototype shown at the Atari stockholder's meeting and the video
>tape given out at CES were of... not an Atari product.. no.. but this CD^32!

we know what the 3DO prototypes were like - did you check for MAC
Quadras?

ooh, and a video tape too. Of course it WAS sourced directly from a
running Jag wasnt it? I`m sure Atari wouldnt cheat.

>> The computer that was going to sell 200000 units in the first year
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
>I never heard that one. Tell me, where did you here that?

It was supposed to be a *MASS MARKET* machine. I seem to remember
reading the 200000 figure in an Article by an Atari magaizne guy.
The projected sales figures just keep going down as noone is buying
it.....

>>impact on the home computing market is ***ZERO***

>That's subjective. :)

Thats a hard FACT

>So having more dealers pop up and making a system that is technologically on
>the cutting edge for music applications is a disaster?

its an excellent computer for music. A shame it hasnt more broad
based appeal. I`d buy one IF i wanted a music machine. I DONT right

now, and neither do the computer buying public

>Well, that's true. But would the Amiga advocacy groups have any traffic if

Lets get this stright. I dont actually hate the Falcon. Its a nice machine with some good points but it *HAS* been a commercial flop thanks to poor marketting by Atari. It doesnt have much software support to speak of, and almost certainly never will.

Likewise with the Jaguar. If its as good as it promises to be I might buy one, but ONLY if it has software support and a future. I believe it will be late and Atari will screw up its marketing.

You Atari advocates had better realise that its stupid advocating a company like Atari. Its the machines that are important. I started computing on an 16k Atari 400, moving up to 32k then 48k then an 800XL with 1050 diskdrive. Even then Atari were CRAP. Thnigs havent changed. I moved up to an Amiga from the 8-bit - a logical choice. I also thing commodore are as bad as Atari, but I love the Amiga. When the time comes to upgrade to a radical new machine in a few years, I doubt it`ll be the Amiga as C= have not shown any signs of developing the line in the future.

So you're saying....

The Falcon is DEAD. I have heard from several sources, which of course
I will not name, that there is no possiblity of software support.
Clearly Atari is about to go under, and the company as a whole is dead
as well.

You sound too much like Marc Barrett for my liking.

I have never read so much pseudo-technical bullshit from a more ignorant group of posters. The 64-bit MIPs chip is the reason the Jaguar flies w/ it's 64-bit bus support. This thing according to the onlt info we have can render 850 million pixels/second (probably page-blit) compared to 64 million for the 3do, and 1 million for the Genesis and SNES.

I've never HEARD of the CD32, but you know what? It DOESN'T compare at all, from the descriptions I've weeded out from the garbage you've all been spouting. The Jaguar has 32-bit color (read 24-bit w/ 8-bit alpha channel), unlimited sprite size (w/ in screen resolution) and excellent networking expansion possibilities. It's performance, worst case, is like the 3DO's for 1/4 the price, 1/2 the price if you get the CD add-on.

The 68000 is an AUXILLIARY controller. That's it. This is GRAPHICs hardware, where the "co"processors are really doing the work, while the 68000 is not a CPU, but a general-purpose aid, for simple tasks that might be less of a priority than other things.

If this post has been too difficult for anyone, I'm sorry. I tried to use small words for you all.

> Come to think of it, does anyone really do Assembler on RISC machines?

YES! Post this question to comp.sys.acorn and wait for the flood of replies. The ARM has a lovely, elegant assembly language and many people work with it in the Acorn world. The best examples of this are the fabulous packages Impression - a dtp package that just flies and Artworks - a corel draw type package that just makes corel draw look like it has hung. Both packages written in 100% ARM assembly.

Not if you live in Europe, particularly the UK, Flip :-)

But at any rate, sounds like ATARI: 'ATARI has little credibility
as a games company, and NONE as a computer company' :-)

[big love-hate between Flip and Greg deleted :-)]

|>
|>
|> I would suggest you study the Jaguar specs more carefully, and then post.
|>

I got the latest EE-TIMES here. BTW, Flip, the CD-32 was discussed
in EE-TIMES two issues back, having a more than twice bigger article
than the one for the Jaguar here, and even mentioning that they wanted
to go against 3DO... just in case you still think the CD-32 is known
only in C= HQ, although is a pretty good approximation anyway :-)

Okay, I am looking RIGHT NOW at the block diagram supplied by ATARI...

It has a 64-bit system bus... ah, let's check this:

'The Tom chip set is a core ASIC equipped with a 64-bit RISC-based multiprocessing architecture, said Miller'.

Well, okay, looks 64-bits to me... although it seems that I read elsewhere that this is the only 64-bits 'processor' in the whole things (Jerry being 32-bits and the 68000 16-bits)

Flip, you got 1 point to your favor :-)

So no CD-32 in the US? Hmmmmmmmmm... I understand the decision, but
if they do this, they are possing themselves more vulnerable to go against
Nintendo when Nintendo releases the Reality system.

Oh, well... but I can understand... hopefully they'll have the adapters
for the A1200 here...

Greg, I hate to jump on you (take it whatever way you want :-) ), but
I think that you are jumping to conclusions to quick. It might be reasonable
what you say, but looking at the latest EE-TIMES, it seems the Jaguar indeed
has some 64-bit stuff.

Well, sorry to burst your bubble Brian, but so it appears to have done.
Where's the Falcon?

But just in case, I like the Jaguar and I KNOW it isn't vaporware (see
for who I work for).

## 1421. Why so anti-Jaguar?

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-03 00:41:41 UTC
From: ricardo@rchland.vnet.ibm.com
Message-ID: <1993Sep03.004141.42466@rchland.ibm.com>
Source record: 21904
Cross-posted to: comp.sys.amiga.advocacy,comp.sys.atari.advocacy

This post is for those Amiga owners that critizice soooooooooo
much the Jaguar (Greg....):

GUYS, it doesn't matter if the 68000 is the actual CPU or not.
It DOESN'T MATTER if it is only 32-bit (which I now really doubt, I think
it has definitively some 64-bits stuff in it)....

*IF* the Jaguar can truly do real-time animated 3D texture mapped
graphics....

>>>>>>>>>>>>>>>> IT IS AWESOME

(hardware-speaking)

To those that argue about the Jaguar this and that, if what you argue
about is for the sake of de-hyping or clarifying the 'general' ATARI specs,
okay. Just don't flame the whole system because for example, a 68000 is the
true CPU (if this is true, which I see it likely). A 68000 system
at 13Mhz with the proper co-processors can kick serious butt!

Hey, even a 6502!

BTW, Greg, if kiddies like more the Sega Genesis, that's more because
of marketting and Sonic than anything else. In fact, I think that kiddies
are liking more and more a Super-NES.

---
LAST Word:

I agree with John Campbell anyway (CATS guy). If there's no
good 3rd party support for the Jaguar, bye bye Jaguar.

---

Thanks.

Geez, that's not even promised until _1995_! And the way dates slip
in the electronics biz, I'd be surprised to see this before 1996.

Stuff like the Jaguar and 3DO are worth worrying about, because
(supposedly) they are to be released within a few months of the
CD32's release. But it's crazy to fret about something that even
marketroids aren't promising until 1995.

: technical factors, I still respect his grasp of that aspect of things. What's the
: real story, compadre?

As a sidenote, what's wrong with judging systems solely on technical
factors? Judging them by the software they run isn't fair; it's too
dynamic, and it's application-dependent. The CORE of the system is the
hardware itself. Start off in a wheelchair, and it's not likely you'll
be able to walk. Start off walking, and while you may be in a
wheelchair, there's no reason that you couldn't change your mind and walk.

Awful, awful analogy, my apoligies, but it's the only thing that comes
to mind.

And thanks for the compliment, even if undeserved.

: Any Archimedes owners like to comment on RISC chips not being meant for
: general purpose use?

The term _DSP_ says it isn't "meant" for general purpose use. However,
some DSP's are determinantly more "general purpose" than others. The
most common example to use is the comparison of the 3210 to the 56001.

And I wouldn't say a word against the Arc, it's a pretty cool design. If
only Apple didn't have such a hand in it; in the future, that design will
have less and less to do with speed, and more and more to do with reduced
power consumption; Apple has so much as said so, in an EN article I was
reading about 2-3 months ago.

Sounds intriguing! Just out of curiosity, aren't Apple and 3DO using ARM
processors in Newton and 3DO respectively?

## 1428. Akiko

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-03 06:24:36 UTC
From: cs922097@ariel.yorku.ca
Message-ID: <1993Sep3.062436.19853@newshub.ariel.yorku.ca>
Source record: 21913
Cross-posted to: comp.sys.amiga.advocacy,comp.sys.atari.advocacy

I just wanted to say something about the possibility of adding the Akiko chip to new 1200s and 4000s. It certainly should be possible to do this as the CD32 is basically a 1200 w/Akiko. The fact that developers chould not rely on this is also irrelevent. The new computers could be given names such as "A1200 Akiko" and "A4000/030 Akiko" etc. Software could be clearly labeled. It should be possible to check for the presence of an Akiko chip and implement software emulation if the computer lacks one. Not being able to depend on certain hardware has never bothered PC developers. That's why so many people feel compelled to buy newer and faster PCs all the time.

Perhaps the Akiko chip could be added on to a CPU card. If not oh well. I have an A4000/030. And even if the Akiko chip could never be added and they came out with an Akiko version I wouldn't be upset. In fact I'd be happy. It would give me something to aspire to. I don't think having the latest and greatest computer is very fun. Theres always gotta be something better.

Commodore SHOULD continually upgrade their line.

In the worst case if commodore couldn't put the Akiko on the MB or CPU card they could always make an Akiko Zorro III or PCMCIA card.

If anything however... Commodore definitly should put out a low end Akiko machine. A1200 Akiko. Or A600AGA Akiko. An A600AGA Akiko for say about $499 retail would sell like hotcakes in Europe. I don't know about the US though. Totally different market.

David Zvekic.

>changed.

Yeah. The Apple II, and the IBM PC with their beeperclick sound, non-existant hardware sprites, and sub-par/nonexistent color graphics were superior by LEAPS and BOUNDS!

The C64 would have been the only other machine I would have considered buying, besides my Atari 800. Later bought an ST when I was $1000 short of an Amiga 2000, and I have been very pleased with it. I'll be buying a second-hand Amiga 500 to play games on. I REFUSE to fall into the Clone/Mac marketing vortex.

Atari and Commodore have built better machines, but guess who hired the better marketers? :(

To me, this doesn't seem feasiable, as a risc = reduced instruction set,
meaning that you will need to build functions using smaller functions.
The upshot is that your risc binary executable for the game engine is
going to be about 5x bigger than the same game engine coded in cisc
68000 binary.

Unless the code is copied from ROM to RAM, you're going suffer some speed
loss with the 64bit risc processor trying to execute code from ROM.

: Come to think of it, does anyone really do Assembler on RISC machines?
:
: (yes, i know it is possible, but it seems to me that the only people who
: should would be compiler writers, because they would know how to do things
: like affect instruction ordering for maximum performance, and i can't see
: the advantage in tweaking too much RISC code if the compilers are good...
: but then i'm assuming the compilers exist and ARE good. :) )

Yes, there are lots of ARM series risc assembler programmers (just ask
the Archimedes newsgroups). But the ARM is a relatively widely available
and documented processor compared to the as yet unnamed 64bit risc processor
that Atari have made. Atari have not made any noises about using it as
a general procesor, which seems to me to indicate they don't have an
operating system or global programming model.

: And of course it won't have a "true" operating system in the sense of a
: computer, but it must have something...

Not necessarily. From what I've gathered the Sega and SNES do not have an operating system, it is left up to the programmers to use the CPU and custom chips anyway they see fit.

I've only seen some cross-development tools, mainly tools to read and write disks that a Sega and SNES box can use with the appropriate hardware, a few cross-assemblers where you have to use menomics (sp?) and graphic conversion programs.

>You sound too much like Marc Barrett for my liking.

No. MB makes posts like `I have heard from an Insider a C= that ..
etc etc` which later turn out to be totally unfounded and sometimes
just malicious lies.

I`m merely pointing out that the sales figures, the general area
of software support etc. all indicate that the Falcon has flopped
bigtime. It was supposed to be the `Amiga Killer` that would sell
hundreds of thousands for Atari and pull them out of their financial
troubles. It has sold in the low tens of thousands and to a very
specialized market of music makers. Atari owners were touting the
machines advanced graphics and sound, claiming it was going to run
awesome games, bring high productivity packages to the home and it
*didnt*. In many ways, the Amiga is in the same boat in the USA. It
really sells only to the specialised video market, and there is very
little uptake amongst home users at large. Fortunately for the
Amiga, it has strong sales in Europe and the rest of the world to
pull it through - the Falcon has pretty much failed to make an
impression in the wider marketplace anywhere.

I`m certainly not saying that I know a source at Atari who says it
is dead. I`m merely observing that there seems to be little software
about for the machine and that the low sales figures would indicate
that there is little likelihood of it ever taking off. I`m not
saying the Falcon is crap - just that it has pretty much flopped. If
we saw the Falcon drop in price to 300 UK pounds to compete with the
A1200 in Europe it could have a chance. There would also have to be
an 040 based box with slots for the pro-users. Atari dont show much
sign of developing the basic machine any further, does it?

Nor is Atari dead. But lets face it, its in such a dodgy financial position that C= looks secure in comparison. Considering that the Jaguar would appear to be such a radical new design, I really doubt that Atari have the necessary technical and financial clout to push the project through anywhere near on time. Just speculation from me, of course, but well founded I believe.

Gavan.

>Time will tell.

Hmmm, its been around about a year now and not much seems to be
happening. If the Falcon and the Amiga 1200 were such a radical step
forward over their predecessors as the ST and Amiga were, then I
would say that the Falcon still has a chance. After all, the ST
initially beat the Amiga in sales. Unfortunately, the 32 bit market
isnt the radical new arena that the 16 bit market once was. Its just
a continuation of the 16 bit market with the machines upgraded a
bit. Sort of like when the 8-bit market went from 48k to 64k as
standard. Hence, the Falcon just reflects the continuing demise of
the ST market. I cant really see the fortunes of either the Amiga or
Falcon/ST changing much in the future - the ST declining rapidly,
the Amiga declining more slowly.

Yep, but theres no point in fanatically raving about the `next big
thing from atari` all the time. As I said, I`m not slagging off the
Falcon, just making a commentary on its market position and future
as I see it.
If you dont agree, fine, I`m not guaranteed to be 100% correct all
the time and I could well be totally wrong.

I meant that Atari corporation were Crap at marketing and
developing the machine. The 8-bit itself was *excellent*, by far the
best 8-bit machine and totally outclassing C=s rather pathetic C64

>Atari and Commodore have built better machines, but guess who hired the
>better marketers? :(

C= marketed the 64 much better, but neither have done a good job of
marketing the ST and Amiga. Thats why both machines have declined to
a certain extent, but subjectively the Amiga has done much better
than the ST due to its inherent hardware superiority.

|> Where's the Falcon?

My bubble never burst, didn't even get a bruise!

Since a stock A1200 can not perform on an even par with the Falcon, you have to go out and buy special memory to be just 15% faster than the Falcon, and the A1200 has no Midi, DSP, SCSI, or memory management capabilities. I'd say the A1200 has had ZERO penetration into the MUSIC market that the FALCON is aimed at where whiz bang, and basically much superior video modes, are of no real value. I also do not expect the Falcon to penetrate the video market either.

As to where exactly the Falcon is...
It's in music and computer stores near ME :)

>CH> Amiga A4000 actually has an '040 in it, and nice graphics; pity Atari's

>Ehrm .. 256 colours ... yeah .. very nice ... (We all know HAM is useless)

Not true. HAM8 provides 262000 colours on screen at a resolution
of up to 1280x512 (more with overscan). Even a standard 640x512 HAM8
screen looks indistinguishable from a 24 bit screen. Considering you
get this in a computer for HALF the cost of the falcon, the display
is unrivalled. The only drawback to HAM8 is that it is tricky to
draw freeharnd on. As a display screen it is near perfect providing
18 bit quality in only 8 bitplanes.

Oh, and the Amiga provides a FULL 24 bit palette.

CH> never going to release another computer (after all, they're
CH> concentrating on the Jaguar now).

They will develope 040-based Falcons for the Jaguar-sales money ...

sez who? Talk about speculation. At least I try and keep my
comments factually based. You are theorizing that
(a) the Jaguar will be a huge success which will
(b) be used to fund `mega - falcons`.
On what evidence do you base this theory, presented as a `fact`?

My _speculation_ of the outcome of successful Jaguar sales is
that Atari will quietly drop the Falcon. Why? Well, like any
business Atari will want to make money (Ok, they have been
spectacularly unsucessful so far, but they`re still trying). The
Falcon cant be much of an earner and a really sucessful Jaguar will
mean Atari concentrating on their money earner. Why throw good money
after bad on an unprofitable Falcon?

C= may well try a similar trick with the Amiga _if_ the CD32 is a
sucess. However, given the close compatibility between the Amiga and
CD32 (they are really the same machine) at least a continuing source
of software should be available for Amiga owners. Since the CD32 has
the _potential_ to be expanded to a full Amiga and C= are
_supposedly_ making a CD32 add on for the A1200, the long term
future of the A1200 would actually be enhanced by a sucessful CD32.
You cant say the same of the Falcon and Jaguar which are completely
incompatible.

Gavan

# 1438. Re: Jaguar: It's time to face the facts...

Boy, I'm hesitant to leap into this particular discussion. I don't (yet) own
any machines by Commodore, Nintendo, Sega or any of the various Atari
companies.

However...

In article <261qsfINN5j5@flipper.pvv.unit.no> eyvind@Lise.Unit.NO (Eyvind Bernhardsen)
writes:
>Ah, and the jury is still out on the 64 bits. Apparently, the DSP only has
>a 32-bit path to memory, and the CPU only has a 16-bit path to memory.

In fact, the diagram that was posted a while back shows a 32-bit path to the
cartridge/CDROM port as well. It appears (again, from the diagram) that the
only chip that has a 64-bit connection to the system bus is Tom. I suspect
that the 64-bit system bus is *internal* to the Tom chip, and that Tom has
a 32 bit path to Jerry, a (possibly different) 32 bit path to the cartridge
port, and a 16-bit path to the 68000.

That *does not* mean that it can't still be called a "64 bit" system; it
just means that there isn't a distinct 64-bit external bus of any kind.

It would also imply that "Tom" is probably where most of the real work happens;
it appears he's the only one with direct access to that 2 meg of RAM, for
example. That leaves me wondering just what the 68k *is* being used for...

Incidentally, I've noticed that this discussion is much more heated that what
I'm used to in other groups. In particular, the amount of name-calling is
surprising. Is it always like this here?

Simply put, technical factors don't translate into fun or affordability.

>Judging them by the software they run isn't fair; it's too
>dynamic, and it's application-dependent.

The software is the key factor. Just having the potential to run great
software proves nothing. I believe the Amiga has the potential to run
applications which are better than MS Word, MS Excel, 4th Dimension,
Aldus Freehand, Adobe Illustrator, etc.--we don't see such for the
Amiga, though. The Amiga could easily handle the latest crop of clone
games, too--IDE or SCSI doesn't matter when developers write floppy-
only software.

WHAT high-level language? Nowhere, in any of the "information" we've
gotten, has anyone claimed that there is a high-level language available
for the Jaguar's alleged RISC CPU. A decent C compiler for any machine,
let alone a RISC, takes year or more to develop - and who's going to do
such a thing for the Jaguar? As far as I know, Atari isn't exactly
heavy on compiler developers. Without positive evidence to the contrary,
I'm not going to believe that there *is* such a beast.

>Since a stock A1200 can not perform on an even par with the Falcon, you have
>to go out and buy special memory to be just 15% faster than the Falcon, and the

Its not `special` memory. Its standard 32-bit RAM (might be
special on the Falcon tho` as you are stuck with 16-bit ram :^) )
Any serious user wanting to expand beyond the *standard 2 MEG*
will buy this RAM which, as it doesnt have to share with the custom
chips, allows the machine to execute at twice the speed of a
chip-ram only A1200. You dont get this option with a Falcon as ALL
RAM is shared with the custom chips.

BTW, are you saying that an A1200 with a memory expansion is
actually 15% **faster** than the Falcon? So much for the `Superior`
030 architecture of the Falcon. Looks like that 16-bit access is a
killer after all!

Given that, in this country anyway, for the price of a Falcon
which comes with a measly 1 meg of memory as standard, I can get an
A1200 with 6 megs (2 meg chip, 4 meg fast) and an 80 meg HD.
So, for the same price the Amiga is 15% faster, has 6 times as
much RAM and an 80 meg HD as opposed to a floppy. Its not much
surprise that the Falcon isnt selling very well, is it?

>A1200 has no Midi, DSP, SCSI, or memory management capabilities. I'd say the

Thats a valid point. The Falcon scores in this area for sure.
However, although techies on usenet might get excited over these
things, the great computer using public doesnt. For all the `extras`
the Falcon has, they really dont make any difference to the majority
of users. And of course, you pay twice as much for the Falcon so you
arent getting these extras free.

>A1200 has had ZERO penetration into the MUSIC market that the FALCON is aimed at
>where whiz bang, and basically much superior video modes, are of no real value.
>I also do not expect the Falcon to penetrate the video market either.

Of course the Amiga has had zero penetration into the Music
market. It cant hope to compete with the 16-bit sound and DSP of the
Falcon. Its the HOME market where the bucks are and these features
are largely irrelevent to the home user.

>As to where exactly the Falcon is...
>It's in music and computer stores near ME :)

Its not in very many stores in the Uk ...

>68000 binary.

That's an understatement, if I've ever heard one. Reduced instruction set means that each function will consist of *more* instructions than on a CISC design. The instructions will execute a lot faster, but there will be many, many more of them. I've yet to see a RISC architecture that didn't have executables from 2 to 3 *times* as big as equivalent CISC executables.

And, since the instructions are, mostly, far less functional than CISC instructions (typically, they do only *one* thing, not the three or four or five that a CISC instruction can do), coding RISC in assembler is an exercise in developing one's typing skills - not to mention the fact that organization of complex code is just that much harder.

>Unless the code is copied from ROM to RAM, you're going suffer some speed
>loss with the 64bit risc processor trying to execute code from ROM.

Hey, hey, hey - how about that, boys and girls - another unanswered question from Atari.

Yep. In addition to the above Beta/VHS slam, Trip Hawkins (the mighty king of
3DO) said that Atari would NEVER sell any Jaguars, that it's just a modified
32-bit system, and that Atari has no credibility anymore.

Sounds like he's a little nervous to me.

>
>If so, the Jag must be a legitimate threat... but 3DO is more than a game
>machine (and priced like it is more...).

Yes, but the "more than a game machine" things that are supposed to come out
are CD's that have been available for months to years on PC's. I haven't
heard anything that the the 3DO can do that, according to specs released for
each system, the Jag cannot.

# 1446. A1200 15 pc Faster than Falcon?

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-03 13:23:35 UTC
From: p9166475@athmail1.causeway.qub.ac.uk
Message-ID: <9309031321.AA01375@bot9>
Source record: 21928
Cross-posted to: comp.sys.amiga.advocacy,comp.sys.atari.advocacy

From c.s.atari.advocacy, bjgrier@bnr.ca (Brian Grier Perpk) writes ..

[deleted]

>Since a stock A1200 can not perform on an even par with the Falcon, you have
>to go out and buy special memory to be just 15% faster than the Falcon, and the

can anyone confirm these figures? I know a while ago there was a big
debate over the slowdown of the Falcons 16-bit access.

I think that the 68030 is inherently about 10-20% faster than the
020 and of course the Falcon runs at 16Mhz. So the Falcon should
theoretically be some 30-35% faster than the A1200. Of course, the
16-bit memory access would slow things down somewhat. Also, since
the A1200 comes supplied with only chipram, it is slown by half.
According to Brian Grier Perpk, an A1200 running with fastram will
outperform the Falcon. An candid admission by an Atari advocate ...

As I posted in atari.advocacy , you can get a 6 meg ram/ 80 meg HD
A1200 for the same price as a Falcon here.

So pound for pound..
^^^^^^^^^^^^^^^ <- Spending same on A1200 as Falcon...

The A1200 is 15 % faster.
The A1200 has an 80 MEg HD, the Falcon a floppy (HD costs more)
The A1200 has 6 megs, the Falcon 1 (more memory at extra cost)
The A1200 has better gfx capabilities than the Falcon
The A1200 has more software than the Falcon
The A1200 has a much wider userbase than the Falcon
The A1200 has a better multitasking OS than the Falcon
The A1200 has more peripherals than the Falcon
The A1200 is outselling the Falcon 10:1

The Falcon has 16-bit sound, The A1200 8-bit
The Falcon has a DSP, the A1200 none
The Falcon has a SCSI port, extra cost for A1200
The Falcon has a LAN port, extra cost for A1200
The Falcon has MIDI ports, extra cost for A1200

I think its pretty clear that, unless you are into music for which
the Falcon is ideally suited, the A1200 clearly is the more suitable
machine for the average user. Of course, the Falcon can do many
things excellently, but the A1200 does them better and there is much
better software available for it.

THATS why Amiga owners get pissed off at the constant sniping and misinformation from Falcon owners (many of whom are only Falcon wannabes).

# 1448. Some speculations on the Jaguar

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-03 14:43:36 UTC
From: broehl@sunee.uwaterloo.ca
Message-ID: <CCs8wp.H6K@watserv1.uwaterloo.ca>
Source record: 21930

I've been examining the block diagrams and spec sheets that have been posted, and I've got some speculations about processors, RAM and ROM usage.

[ NOTE: I have no intention of getting into the "is it a 64 bit machine" controversy; you can argue that back and forth forever without resolving anything. What I'm trying to figure out here is which processor is "in charge", how the RAM is used, what must be stored in the cartridge ROMS, etc. ]

Clearly, Jerry isn't the brains of the operation. It's a self-contained processor with 8k of RAM on-chip that it probably uses for both instructions and data; my guess is that it gets put into a mode that lets its RAM get loaded up by whatever processor is in charge (the 68000 or Tom), and from then on, it cheerfully does what it does best (sound, external i/o, etc). If it accesses the cartridge ROM at all, it would only be for retrieving digitized audio data. The DSP almost certainly wouldn't be touching the system (video) RAM.

Tom has 4k of static RAM on-chip, which it probably uses for its own stack, variables, etc; this implies that it's not using part of the video RAM for that purpose (which makes sense).

Now, from the Q & A session:

> A. Atari's position is that the Jaguar uses a 64-bit distributed RISC
> architecture, a 64-bit data bus, and a 64-bit graphics RISC processor as
> the primary CPU (central processing unit). The 16-bit Motorola 68000
> serves as a subordinate coprocessor, and can only access the lowest 16
> bits of the bus.

By referring to the 68000 as a "subordinate coprocessor", they're clearly trying to downplay it, since it weakens the case that the Jag is a 64-bit machine. However, from the press release:

> - Motorola 68000 (processor #5)
> - General purpose control processor

So they're hedging their bets by referring to the 68000 as the "control" processor. My guess is that the 68000 is "in charge", but that the bulk of the actual processing is handled by Tom (which is why they can legitimately say that Tom's the "primary" CPU -- it's doing the real work).

The 68000 also has direct access to the ROM and and the 2 Meg of RAM (the "DRAM memory controller" on Tom probably handles this).

Frankly, I can't think of any other reason for the 68000 to *be* there, unless it's the one handing out orders; there's nothing else it can do that can't

be done better by Tom or Jerry.

And from the developer's standpoint, it's much nicer to program a 68000 than it is to get down and dirty with RISC machine language; I suspect there'll be a good-size library of routines for Tom's processors that you just use and forget about, which do all the real graphics work. Similarly, there'll be a bunch of code for Jerry that you don't need to know much about, that just gets loaded into Jerry's RAM and runs from there.

And let's face it, for arcade style games the code is mostly graphics, sound and i/o (by time and complexity, if not by volume). What's left is basically game logic, which is easily handled by the 68000.

Now, what about the RAM?

From a press release:

> * 16 megabits [2 megabytes] of fast page-mode DRAM.
>
> * Lifelike quality 32-bit color on NTSC or PAL television screens, yielding
> greater than 16 million colors (16,777,216 exactly).
>
> * Screen resolution of 720 x 576.

And elsewhere they explain that the 32 bits is 24 bits of color plus an 8 bit "transparency" or "alpha" channel.

Now, 720x576x4 bytes = 1658880, so (most of) the system RAM is definitely the display buffer. Some of it may, however, be accessed directly by the 68000 for use as a stack, general-purpose storage, etc. In fact, since the 68000 needs *some* RAM somewhere, and since the only RAM it has access to is the 2 Meg, we can be quite sure that this is the case.

Of course, we've heard references to Z-buffering, and it's not clear where exactly that Z depth information is being stored. Perhaps they're using the transparency channel, but that only gives them 8 bits; maybe they're using the remaining RAM (but that also gives them only about 8 bits per pixel). Perhaps they're using both, but that doesn't leave room for much of anything else!

Of course, they may only support Z-buffering in a lower-resolution mode. Let's see... the RAM is 64 bits "deep", so they could either have:

24 bits color + 8 bits transparency = 32 bits: 2 pixels per word
24 bits color + 8 bits transparency + 32 bits Z = 64 bits: 1 pixel per word

Of course, in the latter case they'd have half the display resolution.

I also notice there's no support for double-buffering, unless they do it in a lower-resolution mode. Of course, that still means they could do double-buffering, 24 bit color with transparency, Gouraud shading and 32 bit Z buffering at 360x288, which is better resolution than you find on a lot of video games right now. I know in the PC arena, most games are 320x200 with 8 bits of color. [And that resolution is about right for driving the LCDs

in as Head Mounted Display...]

Now, what about the ROM?

> * ROM cartridge capacity to 48 megabits [6 megabytes] of compressed or
> uncompressed code. When compressed, equivalent to almost 400 megabits.

Not clear on this. "Uncompressed code"? What other kind is there? The processors have to be able to fetch instructions directly from *somewhere*, right? I seriously doubt if they're uncompressing each instruction on the fly; the performance penalty would be pretty substantial. They must be using "code" very broadly here, to refer to data as well.

The cartridge ROMs have to store compressed bitmaps, compressed audio data, plus code for Tom, Jerry and the 68000.

Anyway, just some idle speculations while waiting for real info to materialize...

sigh, how many times has this to be said, the falcon has 32-bit ram, and is accessed as such by the graphics and sound sub-systems. Only the cpu accesses this 16 bits at a time.

|> Any serious user wanting to expand beyond the *standard 2 MEG*
|> will buy this RAM which, as it doesnt have to share with the custom

|> RAM is shared with the custom chips.

Sigh again. The falcon can have up to 16MB (bytes) of st ram, accessed by the DSP etc via a 32 bit DMA. You can also have up to 128 MB TT ram, using simms, and accessed directly by the 68030 (via 32 bit data path I think, but don't quote me on this....). This needs an extra board and takes up the cpu expansion slot, but I'm sure this can be worked round.

John

>I'm not going to believe that there *is* such a beast.
>

Maybe they just ported GNU C. :)

No, really, I admit I'm just speculating. Note that I didn't say such a
language actually existed for the Jag's RISC processor... only that I've
noticed that a large number of RISC machines seem to place the burden on
a high-level language's compiler and not so much on the individual programmer
hacking out some assembler.

(in fact, if I remember correctly.. its been a while, i remember reading that
the i860 does something like this.... it has an instruction, say an add,
like: add x,y,z and because of its pipelined architecture, I believe
it doesn't interpret this as z = x + y, but instead it requires that the
result of x + y be placed in the destination supplied by an instruction
four pipe stages behind the current one... i'd hate to code that by hand!)

However, it is quite possible the games are being done in Assembler or in
some proprietary language or whatever. I do think they have had time to
create a development system (that had to be right up there as a high
priority, because w/o that, they can't even make the games in house!).

>>Come to think of it, does anyone really do Assembler on RISC machines?
>
>Nobody with half a brain cell.
>

Judging from some of the replies i've gotten... i think some Archimedes
owners may be knocking on your door. :)

>>And of course it won't have a "true" operating system in the sense of a
>>computer, but it must have something...
>
>Why "must"?
>

Because something has to be a default state for when you cut the thing on
and there is no cartridge in it. :)

(like i said, not an OS or even an interface to the chips, like an XBIOS,
but something to start the chips up and perhaps some simple diagnostics,
if even that)

>Michael J. Farren farren@netcom.com
>Unconnected with Commodore for almost two years, now!

That's amazing. I've been unconnected to Commodore since I had a C-64. :)
It's a liberating feeling isn't it? :)

I've heard claims from both Atari and Amiga owners about which one is faster. A long time ago, I suggested that we all just get a simple set of benchmarks, and run them on the machines using either GNU C (which should be near identical for both) or straight 680x0 assembler. When I said this, everyone in both campus pretty much rolled over and died because no one apparently wants to back up their claims. :)

Commodore lost $288 million. Their stock decreased by almost 1/2 following
that.

Atari on the other hand was hovering near $0.50 for a long time before their
stock shot up to $5.00+ for a while. I have no idea whereit is at now.

Atari has had losses for 6 of the past 8 quarters.

Considering recent PR, it appears that in comp.sys.amiga.advocacy Amiga
owners are being told that basically Commodore plants to dump their
high-end Amiga line for now to concentrate on the CD^32 and that future
enhancements to their platform are all on hold while Commodore risks it
all on CD^32.

Likewise, Atari is betting almost everything on Jaguar.

Hate to break the news to you Gavan, but neither one of these companies is
terribly healthy... And remember, Commodore was losing money while selling
over 200,000 Amiga 1200s in Europe. (if not more)

What's wrong with the picture if a company is losing vast sums like that
while selling machines?

I didn't see "for sale" Falcons until March here in America. I have no
idea about the rest of the civilized world. So we've had them a whopping
5 months.

Hardly enough time to decide if it is dead or not.

(if 5 months is enough time to decide that, the Amiga would have died in its
infancy... remember the A1000?)

Dave, I trully think the new Akiko will be use primarily with cd based games and not with floppy based games. Those who buy the CD will get teh akiko on a card, or if they got cd^32 they get akiko built in. Therefore if you were sitting down programming for three months you surely don't want to waste time. So you know your throwing this on floppy and less than 1% of those people have akiko so you don't write for it.

Hey, I'm all for it as well, but it appears that all of the folks
boasting about this and that are wimps. I've even thought of a
couple of tests that could be easily coded for the comparison:

Copy from main memory to main memory.
Copy from video memory to video memory.
Copy from main memory to video memory.
Copy from video memory to main memory.

The CPU, Blitter, or whatever the hell else can be used, the only
restrictions being that each should move the same amount of memory
in the same size chunks.

Any other tests that people can think of are also fine, but until
someone actually does the testing, spouting off about X being some
percent faster than Y is silly.

Will there be any takers? Somehow I doubt it, but there will probably
be a zillion lame excuses for not doing it...

>Ehrm .. 256 colours ... yeah .. very nice ... (We all know HAM is useless)

HAM is far from useless. Sure, it's not the display mode of choice for running the Workbench on, but who needs a 262,144+ color Workbench? If you had ever seen the difference between a 256 color rendering of a 24-bit raytrace, and a HAM8 rendering of the same image, you probably wouldn't have said the above. In fact, I have compared several 24-bit images rendered in HAM8 and full 24-bit truecolor side-by-side, and trust me, on most types of images (with a decent HAM8 renderer like ImageFX or ADPro) you will have to look pretty hard to find any difference.

In fact, our CD32 games will use the HAM8 mode to display absolutely stunning animation sequences, and so does several other titles, so it is far from useless.

>CH> never going to release another computer (after all, they're
>CH> concentrating on the Jaguar now).

>They will develope 040-based Falcons for the Jaguar-sales money ...

Why? That would be like throwing money into a black hole. They better put the money into further promotion of the Jaguar instead. The way I see it, Atari is dead as a computer manufacturer, but there is some possibility that the Jaguar might be successful (I guess we'll have to wait and see).

>
>Copy from main memory to main memory.

Well, this should be done several different ways... and i can think of
some sneaky ways for this to be biased.

I can say this... considering that both machines has a nice set of chips
in them that can do amazing things, we will have to make sure the
benchmarks are done strictly using 680x0 code and nothing that makes use
of the Blitter, DSP, etc... which would obviously affect the CPU
performance.

Disclaimer: in actual use, both machines would make more use of their
custom chips than in the benchmarks.

>Copy from video memory to video memory.

I know one argument both camps will offer will be that the Blitters would
be used for that, and not the CPU.

>Copy from main memory to video memory.

Same as above. :)

>Copy from video memory to main memory.

Same as above. :)

Acutally, as long as we stick to legal 680x0 assembler, it should be
problem. Just to cast the first stone, I'll think up some code and
perhaps correspond with you via email about how to make the benchmarks
as generic as possible.

>
>The CPU, Blitter, or whatever the hell else can be used, the only
>restrictions being that each should move the same amount of memory
>in the same size chunks.
>

I really think that to begin with, we should just use the CPU as the
crux of the argument isn't over whose custom chips are superior, but

whose CPU is running faster.

Also, when banging the hardware, there could tricks (as what demo authors do) which would be things we wouldn't see in the performance of the system during a typical session with, say, a spreadsheet. :)

Hey, I'd be happy to run any benchmarks anyone wants to provide. I don't have time (or necessarily the ability) to write the code myself. I also think it is going to be difficult to find anything that will acurately compare the two systems. There are differences that will make some things look good on one machine and others look good on the other. BTW, is the Falcon allowed to make use of it's built in, standard DSP?

I did previously post some numbers for a particular application running on a 16 Mhz enhanced MegaST and the same application running on the Falcon in the same video mode. This showed the Falcon to be nearly twice as fast as the 16 Mhz Mega. I think this is a valid benchmark since it is the exact same application doing the exact same operation on two different machines. I think it may be difficult to come up with a similar application (or benchmark) to compare the A1200 and the Falcon.

Like I said, if anyone could provide or direct me to some executables to be used as a benchmark, I would be glad to run them on my Falcon and post the results.

What are the general implications for computers as they move toward
RISC. Even the amiga is supposed to go to RISC some day. Does this
make assemblers a dying breed? If executables a three times the size,
does that mean a 100 meg hard drive is the functional equiv. of a 30
meg? 3 megs of ram would be as useful as 1?

cmedley@wam.umd.edu ('Flip' Medley) writes:
/Personally, all I know is, for $200 there is nothing that will come close.
/The biggest argument against any machine over $400 (like CD^32) would be
/that if you're going that far, you may as well get a 3DO (The Sanyo model
/may go as low as $550).

CD32 will cost less than US$400 (it has already been released in Europe,
I think)

Jaguar is not out, and won't be in the near future. Prices are unknown. (How
much is a falcon? How much was it supposed to be before it was released?)

Prices on 3d0 are unknown.

The reason the CD^32 will be delayed or not released at all in the US is
that here in the UK and in Europe in general it is proving to be so popular
that dealers have pre-ordered all the machines that C= can make until
Christmas at least.

Actually, those people who do RISC assembler programming need way more than
half a brain cell. There are areas, especially in the low-level layers of VM
implementations in UNIX variants where you have no choice but to do
assembler. OTOH, when I was writing device driver code on the RS/6000
I wrote ~3500 lines of C code and four instructions in assembler, to handle
some endianess problems as I recall.

Ah, but there's a difference. When the A1000 came out there was
simply *nothing* that came close to what the machine was doing.
Now that the Falcon comes out at this time, this is not true.

(Now, the Jaguar does indeed so far seems to be like what I said about the A1000)

Very interesting analysis. Most games will be low-res most likely. It's like
the S-NES- it can have 544x480 or 440 resolution, but is a mode where the
'MODE 7' rotation and scale do not work at all. Only 1 game to my knowledge
uses it.

The good news is that 3DO might do exactly the same and that if they go
at that resoulution the display becomes interlaced.

This is the same way the S-NES and Genesis operate, nothing more. (They compress the data and code with whoever is the CPU).

CD^32 "may" be released in Europe already?

Anyone in Europen reading this own one? :)

Jaguar is not supposed to ship in quantity until early '94, and I believe
roughly 50,000 are slated for the initial rollout late this Fall in NY and
SF.

(small potatoes)

Price on the Jag is *set* at $200. Read the press releases.

Likewise, if you check around, 3DO prices are set by the manufacturer, hence
the Panasonic one is $700 (MSRP) and the Sanyo one is $550 (MSRP).

Anything else you wanna know? :)

Yeah. Whats the difference between the Sanyo and the Panasonic 3DO?
More specifically, what do you get for the extra $150? Higher quality?
More features?

Prices on 3DO are no more unknown than CD-32. Well, at least US
prices. Neither product is available, and basic prices for both have
been announced.

Actually, there has been no official word on what the differences are. I
do know that the 3DO is just a specification... so the Panasonic may include
components not found on the Sanyo, but I wouldn't say that without some
reservations right now, until hard facts became available.

## 1475. Atari vs Amiga

Newsgroup: comp.sys.atari.advocacy

ok. I give up. If the Atari (fill here) suks then why complain about it? If the Falcon030 does not give the A1200 competition, then why bother telling that. It would be obvous wouldnt it? Or is it??

Same with the Jaguar... Its meant to apeal to the game playing masses. The F030 to the music industry... I own a Mega 'E, I like it, it does what I want. Don't like PCs, pain in the ass, always have to change system setups... Mac is too damn slow on screen draws and such... Every Amiga machine I used gurued when I tried to push it.

Hell, now that I am getting back into music I'm considering getting a Falcon030 why? DSP, MIDI, D2d, etc...

It does what I want, I'm happy. So who cares if the Amiga is faster, or better, the experience I've had was very bad...

On this multitasking, I've never crashed my mega when multitasking. Every process I try to do on teh Amiga did. may have improved in the last six months but I doubt it...

on the Amiga people coming here. why? Amiga too dull to talk about? Atarians already know what it can do, why advocate it?

Everyone knows Atari management sux. They make good machines. And as far as r on time). what was the A1200 prob, someothing with a fan or something. backwards I think...

anyways. l8rz for me...

-Kevin Fason

I'm conserned I'd rather wait for a perfect machine then get a screwed one early or on time

# 1476. RISC and the Amiga

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-04 06:53:01 UTC
From: cs922097@ariel.yorku.ca
Message-ID: <1993Sep4.065301.4980@newshub.ariel.yorku.ca>
Source record: 21822

RISC processors generally work this way. They have fewer instructions, but the instructions that they do have they can handle faster than a CISC chip. They come out ahead (hopefully) because while they pay a penalty for having to construct complex instructions out of many simple instructions, they gain whenever one of those simple instructions are used. The simple instructions are generally extremely common such as MOV (move) etc.

The compiler has to provide software emulation for any complex task that might be needed, such as moving an entire block of memory or padding a section of memory with a character etc. The executable this thus larger.

The Amiga of course has a significant advantage. For the same reason that Amiga executables are almost always smaller than comparable programs on other systems. The Amiga uses shared libraries. These shared libraries can be used to perform the complex instructions that the RISC chip lacks. They could even be used to emulate 680x0 code if needed. Something like this is already exists.

The 68040 has a reduced floating point instruction set.The 68882 is like CISC. Whenever a program tries to use 68882 instructions not directly supported by the 040 the 040.library (I believe that is the filename) is used and the program continues normally. The 040 performs common floating point instructions about 8 times faster than the 68882 (according to AIBB).

Anyways while other systems will probably have bloated RISC executables the Amiga can handily avoid this problem as it has done so in the past.

David Zvekic.

GM> can anyone confirm these figures? I know a while ago there was a big
GM> debate over the slowdown of the Falcons 16-bit access.

No slowdown at all. I can't tell you why, bcoz I don't know, but in benchmarks
the Falcon is 50% of the Speed of a 32Mhz 030 TT with a 32 bit bus ..

GM> The A1200 is 15 % faster.

Bullshit.

GM> The A1200 has an 80 MEg HD, the Falcon a floppy (HD costs more)

My Falcon has a 160Mb HD.

GM> The A1200 has 6 megs, the Falcon 1 (more memory at extra cost)

My Falcon has 4 Megs, the A1200 I've seen are all 2 meg.

GM> The A1200 has better gfx capabilities than the Falcon

Hahahahahahahhah.. since WHEN????

GM> The A1200 has more software than the Falcon

Geezyz ... lying again I see?

GM> The A1200 has a much wider userbase than the Falcon

Yeah, playing games is fun. Right.

GM> The A1200 has a better multitasking OS than the Falcon

Hahahahaha .. no MEMORYPROTECTION,

GM> The A1200 has more peripherals than the Falcon

Bullshit.

GM> The A1200 is outselling the Falcon 10:1

According to a COMMODORE magazine in Sweden the A1200 has sol *5000* units here
..

GM> The Falcon has 16-bit sound, The A1200 8-bit

Yup.

GM> The Falcon has a DSP, the A1200 none

yup.

GM> The Falcon has a SCSI port, extra cost for A1200

SCSI-II

GM> The Falcon has a LAN port, extra cost for A1200

Yup.

GM> The Falcon has MIDI ports, extra cost for A1200

Yup.

GM> I think its pretty clear that, unless you are into music for which
GM> the Falcon is ideally suited, the A1200 clearly is the more suitable
GM> machine for the average user. Of course, the Falcon can do many
GM> things excellently, but the A1200 does them better and there is much
GM> better software available for it.

The A1200 is a GAMES-MACHINE .. (cd32)

GM> THATS why Amiga owners get pissed off at the constant sniping and
GM> misinformation from Falcon owners (many of whom are only Falcon
GM> wannabes).

I have a Falcon ... want some real info? Not a single Amiga (1200/4000) or PC (486/386) owning friend of mine has walked from this room without wanting a Falcon!

Your problem is that I know Amiga graphicians ... they HATE HAM ... it's
USELESS for real-world applications .... HAM-pictures looks BAD on REAL
machines that can display colours WITHOUT having to have 10 pixels in between
just to change between black and white ..

"indistinguishable from a 24 bit screen" ... wanna place a bet?

"half the cost of the falcon" .. sure .. without built in SCSI-II, LAN,
DSP56001, 308400 serial .. etc ...
Get real.

GM> Oh, and the Amiga provides a FULL 24 bit palette.

Yes, with 256 colours on screen in useful resolutions.

GM> sez who? Talk about speculation. At least I try and keep my
GM> comments factually based. You are theorizing that

Hehe ... joking again I see?

GM> (a) the Jaguar will be a huge success which will

Yep.

GM> (b) be used to fund `mega - falcons`.

The Tramiels has ALWAYS used external money to support the Atari brand of
computers.

GM> On what evidence do you base this theory, presented as a `fact`?

On my knowledge since my first ST 1985.

GM> C= may well try a similar trick with the Amiga _if_ the CD32 is a
GM> sucess. However, given the close compatibility between the Amiga and

Cd32 a success? Talk about joking .. it's 3 years old technology already!!!

256 colours without special gfx chips .. noone would like to develope a game on such a crappy piece of hardware!

Do you, then, know exactly how Akiko works? Doing chunky/planar
conversion in the CPU is wasteful, no matter what. One would hope
that Akiko eliminates some of that waste by being specially designed
for the task.

> 570 was designed about the same time as the CDTV. It was released
>much earlier in Europe than the US, something like over a year.

This is bullshit. I was working for Commodore at the time, and the
A570 was *not* released much earlier in Europe. Perhaps a *little*
earlier, but not very much. And it wasn't designed "at the same time
as the CDTV". CDTV was available nearly a year and one-half before
the A570 was completed.

>> Apparently, 2 completely different teams designed the 4000 and
>>1200 and the 1200 was done by the team who actually knew the Amiga
>>with the 4000 being done by a generic team of designers.

There *are* no generic designers at Commodore. And Commodore hasn't
developed a system outside of West Chester since the original German
A2000.

The implications? Well, except for the stone assembler wizards, C
is likely to produce as efficient, if not more efficient, code than
assembler coding with a RISC. And yes, executables get bigger, therefore
your hard drive gets "smaller". This can already be seen with Macs,
where a 40 Meg hard drive gets full with only ten or so applications.

If the CPU can only access 16 bits at a time then for all intents
and purposes it *IS* 16 bit RAM (even though the chips might be
storing 32 bit words). Its nice that the custom chips can access at
32 bits but its the CPU that will be doing most of the work when
doing typical applications. Why DID atari go for 16 bit ram access
for a full 32 bit processor - the A1200 may be hampered by coming
with only chipram as standard, but at least ALL ram access by ALL
the system components is full 32 bit.

Whoops, sorry. I was basing my comments on the official release
date of the Falcon. Not the date that they were actually available
(6 months late, in only 1 configuration, 100 pounds dearer than
promised)

>Hardly enough time to decide if it is dead or not.

>(if 5 months is enough time to decide that, the Amiga would have died in its
> infancy... remember the A1000?)

If this was a brand new market, I`d say that yes, the Falcon
would have plenty of time to prove itself. Its not however - its only a
continuation of the 16 bit market ie. ST->Falcon , Amiga 500 -> 1200
and AS I SAID IN THE POST the Falcon merely continues the downward
slide of the the ST line. As I said, both the Amiga and ST are
declining due to PC and consoles. The ST line is *really* dropping
though. I`m not gloating, just stating FACTS backed up by sales.

Yeah, and the A1200 is based on the A500. Trust me, I posted the original
statement ;) Recap: Somebody said that an A500 with extra graphics HW
could beat the CD32. I said that the CD32 IS an A500 with extra graphics HW,
plus it also has a 32-bit CPU. Read the thread.

>Big joke. The A1200 is the worst machine ever released on the home market ..
>68EC020

Falcon - 16 bit crippled 68030

>256 colours (any graphician knows HAM is useless)

Just one of the MANY modes supported by the Amiga. Doesnt the Falcon
also have a 256 colour mode?

The usual `HAM is useless` statement from an Atari owner who cant
match the Amiga display. Try looking at a typical 640x512 256000
colour HAM8 display sometime and tell me it is `useless`. I notice
you dont mention the fact that the Amiga has a full 24-bit 16M
colour palette either.

>8 bit sound...

Thats a fair point. The Falcons sound is infinitely superior to the
Amigas. However, I`ve never heard anyone complain about the sound in
Amiga games, most people are very impressed by it. I guess 8 bit
sound is perfectly adequate for most purposes. Besides, where are
you going to store the 170K/sec needed for 16-bit stereo CD quality
sound?

>Hehe ... there are more Falcon owners than A1200 owners here .. guess why?

Because your countrymen are all as moronic as you?

# 1490. Re: Atari vs the EXPENSIVE world of DOS

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-04 12:03:56 UTC
From: p9166475@athmail1.causeway.qub.ac.uk
Message-ID: <9309041201.AA00593@lis17>
Source record: 21742

>Your problem is that I know Amiga graphicians ... they HATE HAM ... it's
>USELESS for real-world applications .... HAM-pictures looks BAD on REAL
>machines that can display colours WITHOUT having to have 10 pixels in between
>just to change between black and white ..

No they dont. It *is* crap for drawing in but AS I SAID IN THE
POST it makes a perfect display buffer. Lets face it, at the present
time 256 colour screens are the best practical standard for working
in. Higher colour screens are all very well but all systems I have
seen use them as display buffers. Even most workstations only use
256 colour screens for working on.
Only ST users hate HAM - it reminds them of the days when they
were limited to 16 colours in 320x200 while the Amiga had 4096.
As for general gfx capabilities, the Falcon offers 640x480 as the
standard highest resolution (with 256 colours). There are the usual
system hacks and workarounds (amazing how many workarounds the
poorly designed Falcon needs!) in order to get a higher rez but
these of course cant be guaranteed to work with all software (not
that there is much Falcon software).

>"indistinguishable from a 24 bit screen" ... wanna place a bet?

I would actually, get a person off the street, show em a 24 bit pic
and then a HAM8 version. Then ask them to say which is which. I
doubt many could tell.

HAM8 = 260000 colours using only 8 bitplanes (upto 1280x512 + o/s)
Falcon = 65536 colours needing 16 bitplanes (offically only 320x200
more with the
inevitable hack)

The figures speak for themselves

>GM> Oh, and the Amiga provides a FULL 24 bit palette.

>Yes, with 256 colours on screen in useful resolutions.

duh

>GM> (b) be used to fund `mega - falcons`.

>The Tramiels has ALWAYS used external money to support the Atari brand of
>computers.

Get real. Like C=, Atari are out to make money. Their customer
support is pretty ridiculous (like C=). Its one of the reasons why
both the Amiga and ST failed to make headway against the PC while
the mac did make some inroads. Dont expect them to waste money on an

unprofitable Falcon if they can make stacks off the Jag.

>GM> C= may well try a similar trick with the Amiga _if_ the CD32 is a
>GM> sucess. However, given the close compatibility between the Amiga and

>Cd32 a success? Talk about joking .. it's 3 years old technology already!!!

>256 colours without special gfx chips .. noone would like to develope a game on
>such a crappy piece of hardware!

Oh yeah? What else is available RIGHT NOW? The technology exists,
is well known and has never even been exploited to its full
potential. Just look at any Team 17 game to see what a normal ECS
Amiga game can do. Imagine what will be possible with a proper AGA
game.
By the same token, both the SNES and Megadrive/Genesis are also
crappy pieces of h/w but plenty of software companies seem to like
developing games for them - because they will SELL and MAKE MONEY.
Oh, and many SNES/Sega games are *excellent* despite being written
on a `crappy piece of hardware` !

Gavan

# 1491. A1200 15 pc Faster than Falcon?

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-04 12:17:02 UTC
From: p9166475@athmail1.causeway.qub.ac.uk
Message-ID: <9309041214.AA00603@lis17>
Source record: 21756

rickard.troedsson@troed.ct.se (Rickard Troedsson) writes ..

>GM> The A1200 is 15 % faster.

>Bullshit.

I didnt say it. An Atari Falcon advocate did. Read the quote in
the article. You *DO* actually read the articles before you go into
rant mode dont you?

>GM> The A1200 has an 80 MEg HD, the Falcon a floppy (HD costs more)

>My Falcon has a 160Mb HD.

As the article was comparing what I could buy pound for pound for
the price of a Falcon, thats totally irrelevent. Pricing may be
different in your part of the world though.

>GM> The A1200 has 6 megs, the Falcon 1 (more memory at extra cost)

>My Falcon has 4 Megs, the A1200 I've seen are all 2 meg.

Ditto. Read the original post.

>GM> The A1200 has better gfx capabilities than the Falcon

>Hahahahahahahhah.. since WHEN????

This could be debatable. Its certainly not clear cut but I beleive
I have the facts to back me up.

>GM> The A1200 has more software than the Falcon

>Geezyz ... lying again I see?

No need to debate this. The A1200 has more software FULL STOP (or
period for American readers ;-) )

>GM> The A1200 has a much wider userbase than the Falcon

>Yeah, playing games is fun. Right.

It is actually. Its also big business and makes a lot of people
money. Its a valid application for computers.
Anyway, the A1200 *does* have a much wider userbase. Thats a
*FACT* and it means MORE SOFTWARE, MORE PERIPHERALS, MORE OF A FUTURE.

>GM> The A1200 is outselling the Falcon 10:1

>According to a COMMODORE magazine in Sweden the A1200 has sol *5000*
units here

How many Falcons? Worldwide the A1200 is WAY ahead *FACT*

>GM> The Falcon has 16-bit sound, The A1200 8-bit
>Yup.
>GM> The Falcon has a DSP, the A1200 none
>yup.
>GM> The Falcon has a SCSI port, extra cost for A1200
>SCSI-II
>GM> The Falcon has a LAN port, extra cost for A1200
>Yup.
>GM> The Falcon has MIDI ports, extra cost for A1200
>Yup.

I acknowledge the drawbacks of my machine. I`m not so stupid as to
think it betters the competition in *every* way as you obviously are.

>GM> I think its pretty clear that, unless you are into music for which
>GM> the Falcon is ideally suited, the A1200 clearly is the more suitable
>GM> machine for the average user. Of course, the Falcon can do many
>GM> things excellently, but the A1200 does them better and there is much
>GM> better software available for it.

>The A1200 is a GAMES-MACHINE .. (cd32)

So what if it can play great games. At least there ARE games for
it. If games machines are so crap why are Atari putting their hopes
on the Jaguar?
I dont see many Falcons being used for DTP, Databases, Word
Processing etc *in business* (nor Amigas for that matter)

The Falcon is a MUSIC MACHINE - and theres nothing wrong with that.

>I have a Falcon ... want some real info? Not a single Amiga (1200/4000) or PC
>(486/386) owning friend of mine has walked from this room without wanting a
>Falcon!

Not surprising if theyre as stupid and fanatical as you.

>machine that would be 1 instruction and 2 64-bit registers, and on a RISC
>machine it would all execute in 1 cycle.

Yes, I know all that. Even though I program games (among other things),
I'm not entirely clueless when it comes to hardware and computer design.

>Yes, a great deal of what's been revealed so far has been just hype. But,
>there's also a lot of substantial points raised. The 64-bit processor and
>64-bit bus are really truly empowering features of the system, just as the
>16-bit processor-memory bus in the Falcon is a truly limiting feature of
>that system.

What annoys me is that people seem to be totally obsessed with this "64-bit"
magic, and appear to think that it somehow will make Jaguar a success. To me
and the general public, it's irrelevant how wide the data paths inside the
machine are - what counts is the quality of the games. Without eye-catching
and playable games, Jaguar will be a total flop - regardless of it's
possible architectural merits.

Interesting sidenote: The Alice and Lisa chips can exchange data in 64-bit
chunks, and do just that when in 4x bandwidth modes. (Alice is the CD32
DMA Controller, and Lisa is the graphics engine).

Gavan, you should read MY original post. What my point was getting at is
that both Atari and Commodore are in dire financial straits, albeit in
differing circumstances, and it appears both of hinging their profitability
not on their computer lines, but on their game systems. Atari is probably
doing this moreso than Commodore, but it seems to be widely acknowledged
in amiga.advocacy that Commodore needs CD^32 to take off to make money.

>GM> can anyone confirm these figures? I know a while ago there was a big
>GM> debate over the slowdown of the Falcons 16-bit access.

>No slowdown at all. I can't tell you why, bcoz I don't know, but in benchmarks
>the Falcon is 50% of the Speed of a 32Mhz 030 TT with a 32 bit bus ..

Exactly. You proved yourself wrong here. The 16-bit bus effectively
halves the Falcons speed. Remember that the TT has a 16MHz bus.

>GM> The A1200 is 15 % faster.

>Bullshit.

Gee. That's an argument full of substance. Anyone with any kind of
understanding of how the 68020/68030 works will be able to tell you
that the speed of a 68020 running on a 32-bit bus will be higher than
that of a 68030 running a 16-bit bus. I doubt the 15% figure however -
50% faster would be more like it.

>GM> The A1200 has an 80 MEg HD, the Falcon a floppy (HD costs more)

>My Falcon has a 160Mb HD.

And my A4000/040 has two 240MB HD's, and the A1200 here has got a 170M
HD ... You really are thick, aren't you? Gavan was comparing the things
you could get for an equivalent price. How big a HD you have in your system
isn't going to help anyone who's choosing between a Falcon and an A1200.

>GM> The A1200 has 6 megs, the Falcon 1 (more memory at extra cost)

>My Falcon has 4 Megs, the A1200 I've seen are all 2 meg.

Again. My A4000/040 has 18M RAM, my A3000 10M, and our A1200 has got 10M.
Get my point??? Nobody's interested in YOUR configuration. Gavan was
comparing what you could get for the price of a Falcon.

>GM> The A1200 has more software than the Falcon

>Geezyz ... lying again I see?

Why would he? There are tons more software for Amiga then there is
for the Atari.

>GM> The A1200 has a much wider userbase than the Falcon

>Yeah, playing games is fun. Right.

???? I don't quite follow your logic here. What does playing games
have to do with the size of the user base?

>GM> The A1200 has a better multitasking OS than the Falcon

>Hahahahaha .. no MEMORYPROTECTION,

We don't need memory protection. Sure, it would be nice sometimes, but
in general Amiga software is enough well-behaved to manage without. And
what does your beloved Falcon OS do when a program stomps outside its
memory space?? Dump the core? Gee, that's useful.

>GM> The A1200 has more peripherals than the Falcon

>Bullshit.

Another substantiated claim. Could you please be as kind as to mention
what peripherials are available for the Falcon, so we could do a comparison?

>GM> The A1200 is outselling the Falcon 10:1

>According to a COMMODORE magazine in Sweden the A1200 has sol *5000* units here
>..

That was months ago. And considering that Atari hopes to have sold 20,000
units by the end of 1993 WORLDWIDE, that 10:1 figure is probably too low
(since the A1200 has already sold more than 250,000 units).

>GM> THATS why Amiga owners get pissed off at the constant sniping and
>GM> misinformation from Falcon owners (many of whom are only Falcon
>GM> wannabes).

Gavan... have you ever seen a PC with a 24-bit video card? I'm not saying
the PC is a better video platform, just that the ability to throw out
a true 16.8 million colors is pretty serious. And it beats the hell out of
256 colors, whether its on a Falcon or Amiga.

Incidentally, most of the workstations I use are either 4 shades of grey
(NeXT) or 8-bit color (Sun), too, but I think we'd all prefer 24-bit video
(provided it is fast enough) to 8-bit.

> Only ST users hate HAM - it reminds them of the days when they

^^^^^^^^^^^^^

since when were device drivers called system hacks? If so, UNIX is
one sorry operating system. :)

>poorly designed Falcon needs!) in order to get a higher rez but
>these of course cant be guaranteed to work with all software (not
>that there is much Falcon software).
>

This, Gavan, is definitely a mistruth. Let me explain it to you as my
homeboys would lay the word upon ya.

See, the Falcon's video chip, the VIDEL, is fully programmable. It can
do any arbitrary XXXX x YYYY resolution provided it can handle pumping
out the data fast enough. A simple screen driver (BlowUp030) can jack
the machine up to resolutions like 800x600 non-interlaced and even higher
resolutions interlaced. With an external piece of hardware (simply a
clock to synch the VIDEL to a different spec) it'll do even better.

The reason these resolutions are highly compatible is that from day 1,
the Atari ST line had device independent output for all graphics. This

is why all software that was written using GEM will work, even if it is done back in 1985.

>>"indistinguishable from a 24 bit screen" ... wanna place a bet?
>

Oh, I disagree with Atari's claim it is indistinguishable from a 24-bit screen, but then, if I don't have my contact lenses in... :)

>I would actually, get a person off the street, show em a 24 bit pic
>and then a HAM8 version. Then ask them to say which is which. I
>doubt many could tell.
>

I think I could. HAM 8 (like the original HAM) can't make a transition between two opposing colors, like black and white because it has to carry data over from the previous pixel.

>HAM8 = 260000 colours using only 8 bitplanes (upto 1280x512 + o/s)
>Falcon = 65536 colours needing 16 bitplanes (offically only 320x200
> more with the
> inevitable hack)

I thought the Falcon could do (one of the following) 320x480 true color or 640x200 true color?

>
>The figures speak for themselves
>

They say that Commodore is using 8-bit planes in a sneaky way to get more colors. I think that's very nice, and very innovative. However, you should remember that it is still 8-bits of data per pixel and while it should look a lot better than 256 colors, it ain't 24-bit.

>>GM> Oh, and the Amiga provides a FULL 24 bit palette.

That must be why it's sold over 250,000 units in six months.

>Hehe ... there are more Falcon owners than A1200 owners here .. guess why?

Beats me. I haven't seen a Falcon in my entire life. I have seen dozens
of A1200's and A4000's though.

Rickard, are you on drugs? For your own sake, I hope you're only kidding
us with these `arguments'. You incessantly come up with the most ridiculous
pro-Falcon arguments, choose to only see the good points of your machine,
and neglect to see the good points of other's. If you really want your
arguments to be taken seriously, you ought to be a bit more realistic, and
at least admit that other machines may be better than yours in *some*
respect. As it is, you just project a negative image of the Atari community
to the rest of the world, doing the rest of it a great disservice.

>

That's about as silly an explanation for a flame war as any i've ever heard.
Basically what you want to do is flame a machine that has not been released
based on various interpretations of the spec sheet(s) and some block diagrams.

I think the real truth will come out when it ships. And if people are wrong,
it's senseless to run about bashing any other machine that might step on the
toes of the one true God you worship (Commodore :) ) all on the preliminary
information...

RH> wich makes cpu access slower than it should be :-)

I'm no techie at this, but a friend of mine eplained (in very complicated terms) that the CPU<->Memory access in the Falcon would NOT be faster with a 32 bit bus.

Benchmarks shows a 16Mhz 030 Falcon being exactly 50% the speed of a 32Mhz 030 base Atari TT (which has 32 bit) .. that would imply that the Falcon is NOT slowed down in any way.

RH> Again, this is not the CPU.

Well, many of us disagree with you. Programming the DSP is quote fun, and it's *DAMN* fast. Most programs by old democoders are already using the DSP for processor-intensive stuff, and applications needing SPEED will do it to.

By the same logic, a A4000 is an A500 with decent graphics processor and a
32-bit CPU. In fact! An A4000 is an IBM PC but with a decent graphics
processor and a 32 bit CPU. The CD-32 is an IBM PC also!

NOT!

How you managed to contrive CD32 = A500 + 32bit CPU +decent graphics
is really beyond me. The CD32 is an A1200 + CD ROM + Akiko chip - keyboard.

The CD32 is not, I repeat, NOT an A500!
It runs well over twice as fast even without the nifty graphics. As far as
graphics, it runs at least 3 times as fast by virtue of the AGA chipset, and
can do chunky graphics>planer conversion on the fly.

And even if it was an A500. I'd rather have an A500 than a Jaguar!

At least the A500 is a real computer.

>regular posters in this newsgroup.

But surely some of us can stay above it? I claim that CD32 has a 32-bit architecture, despite its 16-bit blitter and 8-bit sound channels. As you've pointed out, video fetches are done in logical 64-bit words. Parts of the chipset are 64-bits wide, internally - that's why sprites grew from 16 pixels wide in ECS to 64 in AGA. This is nearly as pointless as the discussion in comp.arch about what the "true" speed of a CPU that takes a couple of separate clocks or does some clock-doubling is. I'll agree with Greg Block that product specs should be written by engineers and not marketers.

As for the Jaguar, I'm happy enough to call it 64-bit. It appears that it's graphic processor operates on 64-bit words, whether or not the data width to RAM is 32-bit. Since most of the work in a game will be handled by this GPU, it's ok to call it "64-bit". What I wouldn't call it is a "64-bit RISC" system. RISC/CISC really only applies to general purpose processors, not GPUs and DSPs.

The thing that annoys me with all this market-speak is that, well, I think the design of the Jaguar looks quite nice. Very nice, even. But, I had to break through the hype to reach that conclusion. Now that the clouds have cleared, I can see how they're doing it for $200, while still coming up with an architecture that should give great performance where it counts. If they'd just advertised it as a 68000-based console, with an impressive 64-bit graphics coprocessor, a 32-bit DSP, and fast buses where appropriate, it would have saved us a lot of pointless argument! :-)

>>Supply and demand. Supply is very limited, unable to meet demand, therefore
>>there is no market incentive to reduce the price. We've discussed this - I

>>don't claim the situation is a good one. I'm just explaining why it is that
>>the price is high.

>What is the problem with the supply end?

Supposedly high humidity in the Philippines, leading to problems with the connection to the CPU board. That doesn't sound like terribly competent manufacturing, does it?

> Is there some magical part
>in the A4000 that can only be manufactured on shuttle missions?

Of course there's a magical part! It's that good old Amiga magic, that secret "sock removing" ingredient, known only to a few trusted engineers... :-)

>From what I gather, the Akiko chip converts from chunky to planar, but
>no one has said whether or not it actually speeds up the planar
>graphics. I somehow doubt that this is the case, but perhaps I will
>be pleasantly surprised.

Speed them up in what way? Less contention or something? How fast the blitter can draw? No, it doesn't affect those things. Where it helps out is where the CPU is doing scaling, rotation and texture mapping - these things are most easily done with a chunky representation, which must be converted to planar form for each complete frame, for display. Akiko speeds up that conversion.

> The reaction might have been better had
>Commodore announced plans to retrofit AGA machines with the chip
>and include it on current models.

Tricky, since it's part of the CDROM controller (or interface, or whatever). Now, they could possibly do a new revision of AGA, incorporating the conversion hardware, but, since AAA will have chunky modes, I'd rather they didn't waste their time. I want AAA yesterday, if not before.

> It looks like there will be some
>sort of add-on for the A1200, but they say that the A4000 version
>will be later, if at all. What kind of policy is that?

The only reason for the chunky->planar hardware is to make some kinds of games easier to implement. Maybe they figure that A4000 users aren't into these games? Ideally, it would be available for both, but with Commodore's reduced resources, I can see why they'd want to satisfy the bigger market first.

> That's the
>same sort of thing they did with the CDTV and A570, supporting the
>very lowest end machines while neglecting the high end. I swear, I
>wish I knew what sort of logic is behind their decisions.

The low end makes them most of their money.

There is another angle. What if, by the time the A1200 CDROM (with Akiko) is finished, the A5000 is almost ready to roll? There wouldn't be much point developing anything for the A4000, in that case.

# 1511. Silly Question, Why San Francisco?

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-05 13:08:37 UTC
From: int877w@lindblat.cc.monash.edu.au

I've noticed that Atari seemed to have product launches in SF for a lot of their products.

Why SF in particular? Do gay men enjoy Atari's products more than others? I'm sorry if this offends anyone, but my impression was that SF was the gay capital of America, sort of the Oxford Street (Australians will know what I'm talking about) of the US.

Once again, I apologize if this offends anyone, but it is a light hearted question. Images of the Village People dancing around with game consoles come to mind ;-)

- Jim

>I think I could. HAM 8 (like the original HAM) can't make a transition
>between two opposing colors, like black and white because it has to
>carry data over from the previous pixel.

This is not true. In HAM8, you have 64 "Base colours" which can be
used at any time. If you set one of these base colours to white, and
another to black, you can alternate between black and white without
any fringes. By setting the rest of the base registers to something
intelligent, you can avoid fringes altogether.

If you ever find an AA Amiga running ImageFX, try loading up a 24-bit
image and render it to HAM8. Then save this image, and load it again.
Next, load the original 24-bit picture into a spare buffer, and do a
"subtract" operation between the two. Then display it. What you will
see is the "difference" between the two images. For most images, there
will be almost no difference at all (depending on what rendering options
and modules you choose). HAM8 is very different from the original HAM.
Partly because you have 64 base colours instead of 16, partly because
you have a 24-bit palette, and also because you can display HAM8 pictures
in any resolution (unlike the original HAM, which was only available in
320*256/512 modes).

>>>Yes, with 256 colours on screen in useful resolutions.

>Like 1280x400 where you can view the latest scanned centerfold from Playboy?

Maybe, or like 976*612, or like 976*768 in 262,144+ colors. Just like the
Falcon, the Amiga has got programmable graphics chips. The abovementioned
modes are "tweaked" Super72 modes.

>blasting everything to pieces

>IN HAM8!!!!!!!!!!!

This may come as a shock to you, but that is not very difficult to do. Here's how: use a 640*512 HAM8 screen. Make sure all backgrounds and sprites have a base colour at every second pixel. By placing all objects only at even X positions, you will avoid all HAM fringing, and have 262,144+ colour-graphics.

>Do it. Know. Then buy a REAL machine that can display lots of colours WITHOUT
>cheating!

I already have one. And why would I buy a machine that I can't make any REAL money on?? There are lots of money to make in the Amiga games business (contrary to what some people believe), and none whatsoever in the Falcon.

>SB> In fact, our CD32 games will use the HAM8 mode to display absolutely
>SB> stunning animation sequences, and so does several other titles, so it
>SB> is far from useless.

>"animation sequences" .. yeah ... all GAMES will benefit from that right? The
>*GAMEPLAY* will STILL be in 256 colours!!!

A great deal of games will benefit from that, given the new breed of CD-ROM games are of the "interactive movie" kind. One example is "Microcosm" from Psygnosis. At one of the CD32 demonstrations I attended, they showed long excerpts of "Bladerunner" loading realtime from the CD.

Moreover, do you think Jaguar or 3D0 will be any different?? Most games for those machines will be in 256 colours too, since the memory requirements for 24-bit graphics are monstrous. (1.5M for a 720*520 picture, and the Jaguar only has 2M of RAM... try to figure out how to do double-buffering in that mode).

>SB> Stefan Boberg, Amiga/SEGA Programmer - Team 17 Software & LhA Development

>Amiga/SEGA .. both superseeded by Atari/Nintendo ... :-)

Are you serious? Here are some hard facts by ELSPA: (The figures are for England, but holds true for most other parts of europe as well)

Market share by format :

Hardware : Amiga 40%, Sega 30%, PC & SNES share the rest
Software, full-price: Amiga 50%, PC Compatibles 30%
Software, budget: Amiga 60%, PC 15%, C64 15%
Software, cartridge: Sega 70%, SNES 16%, GameBoy & Game Gear rest

The figures are ballpark figures. I do not have the relevant issue of CTW handy right now, but I'm 100% sure that the Amiga had the largest market share in all categories it competed in. SEGA outsold the SNES by far. If anybody doubts the figures, he can check with ELSPA himself.

I know from first-hand experience that Amiga games sell very well in Europe. The first full-price game we produced ("Alien Breed") has sold more than 70,000 copies worldwide. I doubt any Atari game has sold anywhere near that many copies.

It doesn't matter. Most professionals (including us) draw all graphics
using 24-bit paint packages, and then convert it to the desired graphics
mode and touch it up a bit. That way you can produce enhanced versions
of the games when new technology arrives, without having to redo the
graphics again.

>GM> Oh, and many SNES/Sega games are *excellent* despite being written
>GM> on a `crappy piece of hardware` !

>The SNES's hardware is FAR superiour to the CD32 ... where's the
>rotating/scaling/stretching capabilities?

The SNES sprite engine is superior to the CD32 sprite engine, yes.
But in all other respects, the CD32 beats it without trying very hard.
I know, I have first-hand experience with both machines. The SNES is
a pig to program, and the ridiculously small amount of RAM present and
available read-only storage is very prohibitive.

>32 bit path.

You are a stubborn SOB aren't you? Since the 68030 is inherently 32-bit, it
is crippled by the 16-bit bus. For every cache miss, the 68030 on a 16-bit bus
will take twice as much time to fetch data as a 68030 on a 32-bit bus.

>GM> Just one of the MANY modes supported by the Amiga. Doesnt the Falcon
>GM> also have a 256 colour mode?

>Sure, aswell as a true 65536 colour mode WITHOUT any fooling around with "HAM"

No problem:

CLUT Register 0: 0x000000
CLUT Register 1: 0xffffff

Bitmap: 1010101010101010

Voila! There's something called "base colours" in the HAM8 mode. You can
change to any of the base colours at any pixel.

>GM> The usual `HAM is useless` statement from an Atari owner who cant
>GM> match the Amiga display. Try looking at a typical 640x512 256000
>GM> colour HAM8 display sometime and tell me it is `useless`. I notice

>Why should I? I can clearly show you where the colours mismatch! (And, I don't
>STARE at pictures .. I want them to MOVE .. impossible in HAM8!)

This statement only proves that you never have seen any HAM8 animations,
or that you have seen the output of some crap 24-bit picture viewer (like
ViewTek). If you had seen 24-bit pictures viewed with ImageFX or ADPro,
you wouldn't be so cocky.

I'm glad you told me than HAM8 motion is impossible - now I'll just
delete those HAM8 animations I have on my HD, and get another 100M of
free HD space! Thanks!

>GM> Thats a fair point. The Falcons sound is infinitely superior to the
>GM> Amigas. However, I`ve never heard anyone complain about the sound in
>GM> Amiga games, most people are very impressed by it. I guess 8 bit

>Yupps .. probably why Commodore said they'd have 32 bit sound in the new
>Amigas.. they're probably VERY pleased with that 8 bit sound ..

32-bit sound? Sorry, but it's 16-bit. 32-bit sound is way overkill for
any application. And 8-bit sound is more than adequate for games. We
typically sample and process sound effects in 16-bit equipment, and then
strip the LSB and use it in our games. This yields excellent results,
and the difference between the 8-bit sounds and the 16-bit originals
is negligible (I can't hear it, but then I'm not an audiophile).

Furthermore, the negligible quality increase in going from 8-bit sounds
to 16-bit sounds doesn't warrant doubling the amount of memory allocated
for sound effects. We probably wouldn't use 16-bit sounds in games even if
it was available. Realtime replay of CD audio tracks is of course a
different matter altogether, since that does not use any system RAM.

>GM> Because your countrymen are all as moronic as you?

>Yeah sure. How old were you again? Started potty-training?

Newsflash: your posts in this group doesn't exactly communicate the image
of a mature adult, Rickard.

>stated that they've sold only 5000 A1200s here.

You don't have to believe it if you don't want to, but it's true. I am
a commercial Amiga developer, and I know this for sure. Your figure of 5,000
units sold in Sweden is old, but let's assume that it is correct and do
some calculations...

Total number of non-AA Amiga's sold in Sweden since 1986: roughly 100,000.
Total amount of non-AA Amiga's sold worldwide: roughly 4,500,000. Thus, if
Sweden amounts for as large share of the worldwide market as it did earlier,
it would mean that C= has sold:

4,500,000 / 100,000 * 5,000 = 225,000 A1200 units worldwide.

Clear enough?

>No problem. I haven't seen a single A1200 or A4000, but several Falcons! Maybe
>we don't visit the same placeS?

We probably don't, and I can't really say that I'm sorry for it. Maybe
"Hassleholm" is Falcon-paradise, and Amiga-hell. What do I know? But I do
know that the rest of Sweden isn't like Hassleholm, that's for sure.

There might not be one - you can't tell. It's possible that what Atari
is doing is simple shuffling of otherwise reasonable data to make it
look better than, in fact, it really is. That's not quite lying, in
my book, but has much the same effect.

>Well, yes, but Commodore's known behavior in the USA before the Amiga was
>to see a good cheap computer (C-64) in huge quantities, and their behavior

So who's flaming? Or does any discussion where there are disagreements
count as flaming in your book?

>I think the real truth will come out when it ships. And if people are wrong,
>it's senseless to run about bashing any other machine that might step on the
>toes of the one true God you worship (Commodore :) ) all on the preliminary
>information...

Give me a large break. As I have pointed out many times, I was in this
business long before there *was* a Commodore, I programmed for Ataris
and Apples long before I ever came near a Commodore product. Did you
notice, *anywhere* in the postings I've made about the Jaguar, *any*
reference to Commodore, IBM, Apple, or any other company besides Atari?
You did not, and you will not. Get off this "one true God" thing - it
ain't so.

And, if you're going to be so quick to come down on *my* head for speculating about the Jaguar, why don't you come down equally hard on those folks whose postings I'm rebutting - the ones who are all over rec.games.video raving about the wonderful Jaguar, based on exactly the same information (or lack of it) as I have?

>>Unconnected with Commodore for almost two years, now!

>You sure don't act like it. Tell me, did you leave them willingly? :)

No, but what difference does that make? That line is there because some people were talking as if I still worked there, and I decided to set the record straight. Any other interpretation is your problem.

As a former Bay-Area resident, I can think of several reasons why they
would want to launch it there :

1. Silicon Valley.
2. Lot's of MultiMedia hardware/software companies in the area.
3. Lot's of Virtual Reality companies in the area.
4. The press out there is more "tech aware" than anywhere else.
5. There are more computer-literates than anywhere else.
6. It's not New York City. :-)

Bus width is not everything. BTW, Atari tell me the pipelining achitecture
makes the access time more like 24 bits than the 16 bits suggested. Anyway
they could be telling me porkies.

CPU speeds are different too.

Who cares anyway, the Falcon is a better machine.

> And my A4000/040 has two 240MB HD's, and the A1200 here has got a 170M

True. The A1200 has been around a lot longer. What does this prove?

chorus: NOTHING

Thankyou. As long as i get the software *I* *need* to do the job all
else is tinsel.

>>GM> The A1200 has a much wider userbase than the Falcon
>
>>Yeah, playing games is fun. Right.
>
> ???? I don't quite follow your logic here. What does playing games
>have to do with the size of the user base?

How many 1200 are actually used for serious work? Very few. People
wanting to do serious things get something like the 4000 040/030
and buy the extra bit `n' bobs at yet more cost.

The average 1200 owner is a games player and very little else.

And don't bother telling me about what you've got down your pants...
I mean, what makes you think you're average?

>
>>GM> The A1200 has a better multitasking OS than the Falcon

Huh? What are you talking about? The Falcon runs TOS and GEM!

For example, I don't have a Falcon, but my GEM NetHack runs perfectly
on a Falcon, even in 256 colour mode. (since it is a GEM program).

I'm sure you're getting confused with the Jaguar, which, of course,
doesn't have an operating system. Why would you put an OS into a
console? Even many games on the Atari/Amiga don't make any significant
use of the operating system. The "Operating System" of the Jaguar is
whatever library of routines is supplied to cartridge developers. This
is a Good Thing too - because it means that there cannot be any
incompatibilities between the game and the OS - since the game comes
with it's own copies of the relevant routines.

Well, systems have always grown ever hungrier for both primary and
secondary memory, but don't forget there are many things that can also
decrease the amount of storage used. For example, as shared libraries
become more popular, both primary AND secondary storage requirements
diminish.

What you said was that they were saying things about the Jag specs that
are inconsistent. If everything they say is factual (i.e., TRUE) then
there would be no inconsistencies.

If they makes statements that are misleading (i.e., the fact that it has
16 MEG (abits) as opposed to our 2 MEG (abyte) interpretation of the same
amount of RAM) I would bet that 99% of whatever we see as possible "lying"
is akin to the marketing hype that all the video game companies are using.

And I'll be you almost anything that Commodore uses MEGabits for measuring
the CD^32's memory when/if they advertise it against the dedicated consoles
in N. America.

I wouldn't know. But I will say this... when the C-64 was "large and in
charge" you could walk into ANY computer store and see software and accessories
for it.

You sure can't do that with the A500, which incidentally, is no longer
available.

Well, actually, it does make a difference. As an ex-Commie, you would be biased, I would imagine. If you parted with C= on bad terms, I would take anything you said against their products with a grain of salt. If you seem to be overly happy with them, your prior affiliation w/ Commodore makes it questionable as to your possible bias. That's why I personally would question your objectivity and motives in regards to the Jaguar.

Of course, as you said, it is my (and any other reader's) problem to read between the lines to figure out why you feel a need to try to rain on the Jaguar parade.

>Do you, then, know exactly how Akiko works? Doing chunky/planar
>conversion in the CPU is wasteful, no matter what. One would hope
>that Akiko eliminates some of that waste by being specially designed
>for the task.

Yep. And akiko needs the cpu to supply data. To convert 8 longs it requres
the cpu do Read 8 longs from chunkybuffer, write 8 longs to akiko, read
8 longs from akiko and write 8 longs into planar buffer in chipram.

Now think about a simple c2p routine such as a 5 way merge routine merging
words,bytes,nibbles,pairs and finally bits. It merely needs to read 8 longs
from chunkybuffer... do the 5 merges and write 8 longs to chipram. Thats
a saving of 16 writes [ok ok so akiko has 0 wait state on A1200 so i am
told]... but still I make the following bold claim:

On an A4k/040 without akiko a software chunky to planar convertor I have
a routine that operates within 95% of the speed of a routine that would
run on the A4k/040 using akiko. [Maybe even _faster_ once I start
optimising my routine]. If you dont think its possible then think about it!

Regards, James McCoull.

tpp@cbnews.cb.att.com (Grue) writes...

>>
>> You want to spend your time arguing over spec sheets?
>> Get a life!

>What the hell have you all been arguing over?

Well, most people seem to be arguing about the as yet unconfirmed
specifications of the Jaguar vs the As yet unconfirmed specs of the
3DO machine vs the _actual_ Specs of the CD32. Aside from the fact
that the CD32 is the only machine that exists as a production model
(and is on sale) and that the other 2 have yet to be seen in even
near -finished form, I think the point is that specs dont
necessarily guarantee success or fun and enjoyment from the machine.
Whats counts is software availability and THIS is what will matter.

Of course if someone puts about a misleading statement about
specs (as Atari advocates do about Amigas) I will answer back to
correct them.

Its silly to argue about the Jaguar specs as we dont really know
what the final machine will be like. Noone on this group seems to
even agree what the 68000 in the machine is for. Considering the JAg
goes on sale *next month* according to you, its worrying that there
is so little hard facts about the machine.

>>>Um, October. Is that soon enough for you?
>>
>> OCtober 1994 most likely.

>Wow, what a witty comeback. No, October 1993. You asked, I answered. If you
>can't handle that answer, go cry to your mommy.

No point arguing this. We`ll just have to see when it *does* come
out. I`d bet that it wont be til` a LOT later than next month
(Although probably not as late as next october).

>>>Yep, the Atari scene that has Nintendo running to SGI and 3DO badmouthing the
>>>Jaguar, saying the Jaguar is Beta to 3DO's VHS, is really dead. Yep.
>>
>> You have a really vivid imagination if you think that Atari have

>>shit company like Commodore in the home computer market, and now you
>>want to take on Sega and Nintendo (and possible 3DO) in the console
>>market!?

>You must have your eyes closed. Why do you suppose Nintendo announced the deal
>with SGI the day after the Jaguar was shown to the press?

Well, of course the Amiga press are putting about the word that
it was to spoil the release of the CD32 (Sega announced a 32 bit
sega CD on the day of the official UK release of the CD32). I`d
imagine however, that it is just designed to keep Nintendo in the
limelight as they dont have anything to compete with the current
crop of CD consoles and 32-bit machines.

Neither Atari or C= have the dollars (or the marketting ability)
to take on Sega or Nintendo. They`ll have to hope that the hardware
sells itself to a large extent.

I never said they didnt. Theres not that much money to be made in
home computers anymore (non-IBM ones that is). Your post seemed to
be obsessed with taking a swipe a C=s position (not that I`m
defending C=).

Both Atari and C= are dependant on their new consoles being a
sucess. If they are, I think we will see far less emphasis on the
home computers from the two companies. This rather leaves Falcon
owners out in the cold, less so with the A1200 as it is quite
compatible with the CD32 (It needs someone to make a CD32 add-on for
it though).

>the PC is a better video platform, just that the ability to throw out
>a true 16.8 million colors is pretty serious. And it beats the hell out of
>256 colors, whether its on a Falcon or Amiga.

I`ve seen 24-bit and on any machine it is excellent. It certainly
beats the 256 colour modes of the Falcon and A1200. It also has to
beat the HAM8 mode by definition as it has more colours (HAM8 is
pseudo 18-bit). To look at though, it provides the same quality.
Unless you set the screens up side by side you wounld have a hard
time telling the difference.

What makes 24 - bit so good? - Extra colours (~16Million).
How many colours can the Falcon display - 65535
How many colours can the Amiga display - 260000

I think its pretty obvious which system offers the best display.
Take a look at HAM8 sometime, you might find that for most people
its indistinguishable.

(NB A 640x400 display can only have about 256000 colours on screen
anyway, even if every pixel is a different colour, so 24 bit is kind
of wasted even though it still offers better dynamic range)

>clock to synch the VIDEL to a different spec) it'll do even better.

Well, youre the atari expert. I`ll take your word that its easy
and compatible to obtain the aforementioned resolutions.

Still needs an external piece of hardware to avchieve it full
capability though.. Its hard to imagine that atari could have
overlooked this simple modification when designing the machine. I
mean, to not put in a simmple clock to enhance the video
capabilities .. A typical example of the Falcons design
ideosyncracies.

>The reason these resolutions are highly compatible is that from day 1,
>the Atari ST line had device independent output for all graphics. This
>is why all software that was written using GEM will work, even if it is
>done back in 1985.

Any software on any platform that uses the OS properly should
work on any future revision of that machine.

>I think I could. HAM 8 (like the original HAM) can't make a transition
>between two opposing colors, like black and white because it has to
>carry data over from the previous pixel.

HAM8 has 64 base registers which can be plotted anywhere on the
screen. Any colour in the base registers acts as the base for
modification. Therefore as long as one base is white and another
black you can have white and black beside each other.

>it should look a lot better than 256 colors, it ain't 24-bit.

It isnt, but close enough to fool the eye and certainly as good
as a standard composite video/ TV signal which is all the average
punter wants.

What seems to be happening is that atari advocates are trying to
flame the CD32 by citing various interpretations of spec sheets and
block diagrams. I say to the Jaguar advocates - wait and see what
the JAg is like and THEN flame the CD32. Dont try to slag off a
machine that _exists_ by citing one that doesnt (yet)

Yes, there are really lots of games that use the 65535 colour
mode on the Falcon, arent there?

The point is, these modes are useful for displaying static pics.
256 colours is more than enough for games (look at project X in 32
colours on the Amiga)

Oh, and you can sideways (and vertically) scroll HAM8 quite easily

>32 bit path.

A 32-bit cpu **NOT BENEFIT FROM A 32 BIT PATH INSTEAD OF A 16??**

I doubt that even other Atari advocates would take your mindless
rantings seriously......

>Sure, aswell as a true 65536 colour mode WITHOUT any fooling around with "HAM"
>.. (try to go from black to white on ONE pixel in HAM .. big laughter)

As I answered in another post, you can go straight from white to
black provided the base registers are set right.

>GM> The usual `HAM is useless` statement from an Atari owner who cant
>GM> match the Amiga display. Try looking at a typical 640x512 256000
>GM> colour HAM8 display sometime and tell me it is `useless`. I notice

>Why should I? I can clearly show you where the colours mismatch! (And, I don't
>STARE at pictures .. I want them to MOVE .. impossible in HAM8!)

Then look at some ham8 animation. I douby current arcade games
could benefit substantially from any more than 256 colours. The
slowdown would cause real problems with fast blasters and there
would be a lot of memory used (a lot more than the 1 meg Falcon
standard)

>GM> Thats a fair point. The Falcons sound is infinitely superior to the
>GM> Amigas. However, I`ve never heard anyone complain about the sound in
>GM> Amiga games, most people are very impressed by it. I guess 8 bit

>Yupps .. probably why Commodore said they'd have 32 bit sound in the new Amigas
>.. they're probably VERY pleased with that 8 bit sound ..

Where`d you hear that? I doubt even commodore would make a stupid
statement like that.

>GM> sound is perfectly adequate for most purposes. Besides, where are
>GM> you going to store the 170K/sec needed for 16-bit stereo CD quality
>GM> sound?

>Wanna guess? In the 4 meg RAM the BASE Falcon comes with ...

In the UK the base configuration is 1 meg. It may be different where you are. Anway - 4 megs ~= 35 seconds of CD quality sound. Where do you put your programs and memory used by the OS?

>GM> Because your countrymen are all as moronic as you?

>Yeah sure. How old were you again? Started potty-training?

Yep, a cheap jibe by me. But you *really* set yourself up by making such stupid claims. Say something intelligent and I`ll find it easier to resist such jibes.

Thats an authoritive statement. Hey everyone, buy a Faclon coz ;
`the Falcon is a better machine.` sez Xavier.

>Thankyou. As long as i get the software *I* *need* to do the job all
>else is tinsel.

Thats a big truth most people seem to forget. Sadly for the
Falcon, the majority of people find that it *doesnt* have the
software they want. Thats why it has flopped.

>How many 1200 are actually used for serious work? Very few. People
>wanting to do serious things get something like the 4000 040/030
>and buy the extra bit `n' bobs at yet more cost.

>The average 1200 owner is a games player and very little else.

How many Falcons and STs are used for serious work? Id say at
least as many Amigas are used in serious video production, as
Falcons and Sts are used in music studios. It`d be hard to produce
definitive figures though.
Most STs were bought to play games on, in the UK at least, before
the ST games market dried up.

>> Another substantiated claim. Could you please be as kind as to mention
>>what peripherials are available for the Falcon, so we could do a comparison?

>All SCSI peripherals dear. Plus remember the other ports that outnumber the
>A1200 ports 2 to 1.

You can get SCSI for the A1200 too. You pay extra, but an A1200
with SCSI would still be cheaper than a falcon. Oh, and there are
device drivers available for all the SCSI add ons?

>The F030 is twice the price of the A1200, the A1200 is a low level entry
>machine, the F030 a mid level complex machine with a lot of stuff built in.
>Stuff that games players seldom use.

>Amiga users? Please! It is a games machine. I *wanted* to buy one, but
>when I did a point by point comparison it lost out in every field except
>graphics.

As you say, the F030 is 2x price of A1200. That means you can buy
an awful lot of extra add-ons for the A1200 to make it functionally
superior to the F030 for the SAME PRICE. Read my point by point

comparison in the original posting to see what I mean.

>Come on someone! Do the benchmarks and lets see which is faster! All
>this haggling over hypothetical speeds is a waste of time. I want to
>see the *facts*

Yes, try it! But please remember that there are still some difficulties:
- The Falcon definitly HAS a DSP - what evidence do you get from a benchmark which does not use this chip?
- Don't test only memory-movements! The perfomance of a system does not only depend on this (i would estimate that moves cost less than 20% of the time).
- I suggest to test the SAME assembler code on both platforms to get a comparison of the basic system (without custom chips). This code must be extensive - to be honest: i don't want to write it :)
- How likely is it, that the Instruction cache is not used? I expect that the benchmark will not try to bypass this cache :)

Sure, the A1200 will be faster when moving from and in memory - so i hope you will also test all other instructions of the 680x0 (and not only one!).

Ciao, Heiko

further to zcam1121@rpool9.rus.uni-stuttgart.de (Heiko Hartmann)
post....

How about running the standard sieve, fibonacci etc. benchmarks as
compiled under GCC on both?
Then do memory move from CPU-chip
chip-CPU
chip-chip
CPU-CPU
(or the equivelant) on both systems

Then try moving memory around the chip space with the blitter.

Do all tests in various screenmodes to see what effect using
hi-res non-interlaced screens has on overall performance.

Also, A1200 would have to be done for both Chip only and
Chip+Fast ram configurations

Let's see what you just wrote here: 1) You *must* have proper memory
protection. 2) I haven't yet been in a situation where memory protection
did anything useful for me.

That was exactly my point. If you use properly written software, you
don't need memory protection. All pieces of software on my disks are
properly written, and thus won't need the protection. In fact, the Amiga
*benefits* from not having memory protection, making it faster than an
equivalent system WITH memory protection (less overhead).

>The how come the 16Mhz030 Falcon is exactly 50% of the speed of the 32Mhz030
>TT (which has 32 bit and 32Mhz access to FastRam)?

I seem to remember that the TT runs on a 16MHz bus. In fact, when
the machine was launched, I got the impression that is was really designed
to have a 16MHz processor, but was quickly redesigned to use a 32MHz
processor instead - but the bus was never changed. My memory is a bit
hazy though, so if anyone has proof that the TT in fact is running on
a 32MHz bus, they're welcome to correct me.

Another factor to take into account is the speed of the RAM chips. If
your RAM cannot keep up with the bus, it doesn't matter how fast the bus
is.

>SB> I'm glad you told me than HAM8 motion is impossible - now I'll just

When you use a simple blit operation for moving around, there will be
fringes. If you do some trivial processing for the pixels at the right
edge of the moving square, there will be no fringes.

BTW: you always have 64 base colours at your disposal in HAM8.

# 1544. 32 bit sound ???

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-06 15:18:37 UTC
From: steven@abekrd.co.uk
Message-ID: <1993Sep6.151837.9707@abekrd.co.uk>
Source record: 21777

I don't post to this group, infact i hardly ever read it but i did once
and saw a post claiming some machine (CD32 ??) had 32 bit sound capabuility.
....BOLLOCKS

If i go out and spend as much money as i can on audio equipment i couldn't
get 32 bit anything. The most i'd manage was 24 bit internal proccesing.
I think 24 DAC's are available but they cost loads.

In short the differance between 32 and 24 bit anything is nothing to the
human ear(even an audiophiles).

Ok. Tell me were i can get them and i will compile it with GCC 2.44.
(With ot without -O ? :)

> Then do memory move from CPU-chip
> chip-CPU
> chip-chip
> CPU-CPU
> (or the equivelant) on both systems

Why? I think you want to do this "extra-memory-benchies" just to show that
the A1200 is faster in this specific task.
Hm... Well... post the code you want to test... we will see.

> Then try moving memory around the chip space with the blitter.

Ouh, this is hard, because the blitter is mostly used with a VDI-call.
(Bitblt). I doubt that this is good for comparison.

> Do all tests in various screenmodes to see what effect using
>hi-res non-interlaced screens has on overall performance.

Ok. No problem. I suggest the following:
640x480 with 2 colors and 60 Hz
640x480 with 16 colors and 60 Hz
640x480 with 256 colors and 60 Hz
800x600 with 16 colors and 72 Hz
800x600 with 256 colors and 55 Hz
320x200 with 65536 colors and 60 Hz

> Also, A1200 would have to be done for both Chip only and
>Chip+Fast ram configurations

Errh... is FastRam build in the standard A1200 models? Hm...

By the way, i have connected a SCSI-drive to my Falcon. So here are some
figures:

Quantum LPS240 (16ms), not the fastest SCSI-drive at all:
READ: up to 1600 KBytes/s
WRITE: up to 1350 KBytes/s

Built-in IDE-drive Seagate xxxx (don't remember):
READ: up to 450 KBytes/s
WRITE: up to 350 KBytes/s

Ciao, Heiko.

>port, and a 16-bit path to the 68000.

I doubt that very much. Why have 3 separate busses?? That would mean that
the total pins used on the chip to datapaths would be 80, plus another
64 bits for the datapath to the RAM. AND, one of the designers (Miller?) said
that the MC68000 only uses 16 bits of the *64* bits databus (I could be wrong
since I don't have the article in front of me).

>That *does not* mean that it can't still be called a "64 bit" system; it
>just means that there isn't a distinct 64-bit external bus of any kind.

Rudimentary work that you just don't do with a RISC-chip, like polling
joystick-ports, reading data from CD or carts etc etc.

>Incidentally, I've noticed that this discussion is much more heated that what
>I'm used to in other groups. In particular, the amount of name-calling is
>surprising. Is it always like this here?

Nope, but since there are 3 new game-machines released to the public almost
ontop of each other, the advocates of the different camps wants to tell
everyone how good "their" machine is compared to the others.... ;-)

You are correct, the TT's bus is on 16MHz, but it's width is 64 bits.
The CPU in the TT is clocked on an asynchronous clock @32MHz also (eg. only
when accessing ST-RAM).

>organization of complex code is just that much harder.

What are the general implications for computers as they move toward RISC. Even the amiga is supposed to go to RISC some day. Does this make assemblers a dying breed? If executables a three times the size, does that mean a 100 meg hard drive is the functional equiv. of a 30 meg? 3 megs of ram would be as useful as 1?

I think this is overstating the effects of RISC on coding, executable size, disc requirements, difficulty of coding etc. I have spent some considerable amount of time working with both CISC (IBM 360) and RISC (ARM and more recently Sparc), and find no appreciable difference in difficulty of coding. There is a difference in what is required, for a RISC one doesn't have to work hard to make full use of the instruction set as one does on a CISC (which is why compiler writers perfer RISC and indeed one of the reasons it was invented), but on the other hand one does have to expand out those load indirect with several offsets type instructions into explicit sequences. Overall, I think the code bloat factor is nearer two than three. But, this has no effect on the size of the data, so to assume a RISC machine needs twice as big a disc as a CISC is a fallacy. In many modern programs, the code is a relatively small part of the total item, the rest being taken up with data files, sprites, windows, menus etc. RISC vs CISC has no effect on the size of these. As for assemblers being a dying breed, that also seems unlikely, any more than C is becoming a dying breed. Many authors like writing assembler, many are constrained by the "fit it in the ROM" constraint or the squeeze the last ounce of performance constraint, or even when they aren't they feel they are.

Just my 24 pee for a quicky!

Well, they ARE rolling out the Jag in New York, too!

I think New York is a consumer eletronics haven, and San Francisco
(actually San Jose) is a technology hot spot, where a lot of us
electronics junkies hang out.

I bet if Atari was a big Japanese company with lots o' money, they would
roll it out in the Akihabara district of Tokyo, too.

: What you said was that they were saying things about the Jag specs that
: are inconsistent. If everything they say is factual (i.e., TRUE) then
: there would be no inconsistencies.

Do you really believe the 850+ million pixels/sec rendering animation speed?
The 3d0 only gets 64 million? Popular conjecture is that the Jaguar specs
refer to 1bit plane operation, while the 3d0 figures is for max depth
operations. It's like saying my car does 0-60 mph in 10 seconds and the
Jag goes 0-60 in 3 secs (but we're talking about 0-60 feet per hour in
the latter case). Or saying that we have a rotary powered engine in
the Jag, just like the LeMans winning Mazdas, except it powers the
air-conditioner and we have a 4 cylinder engine to power the car...

Or I can say that my Amiga 500 outrenders a SGI system, or a CRAY YMP
system on the following tests:

Amiga 500 Cray SGI RS6000

Mips 1 ??? ??? ????
Rendering 60 infinite infinite infinite
sprites 4 ??? ??? ????

* provided I don't turn on the Cray, SGI, or RS6000, the benchmarks are
100% valid. If I did turn on the other computers, my A500 would like
rather sickly.

Or Perhaps you've read a bit of Sam Tramiel press copy in the MicroTimes,
where he says that the Ataris520ST is five times faster than an A500?
Where did he get that figure from?

A lot of people take advertising copy with a big grain of salt. More so
the EE types, because they have a bigger stake in their industry than
non-engineering types. Professional standards often win out over company
loyalty, and the truth comes out more often than not. Marketing types
have no real concept of engineering, so are quite free to bandy around
all sorts of numbers and figures.

: And I'll be you almost anything that Commodore uses MEGabits for measuring
: the CD^32's memory when/if they advertise it against the dedicated consoles
: in N. America.

I've haven't seen anything about 4.8 Gigabits of data on a CD-ROM...

[...]

: >So who's flaming? Or does any discussion where there are disagreements
: >count as flaming in your book?
:
: When someone runs around picking "fights" because they feel a need to prove
: the superiority of their computer purchase to reduce their own cognitive
: dissonance. :)

If you're going to post the specs in all sorts of game newgroups, like
comp.sys.amiga.games, comp.sys.ibm.pc.games, rec.games.video and have
everyone take it as "law", then you're sadly mistaken. Better beat up
on those Atari advocates for posting the specs willy nilly in all the
games newgroups then.

If you're posting specs in any sort of .advocacy newsgroups, then be
prepared for some scrutiny.

: >>I think the real truth will come out when it ships. And if people are wrong,
: >>it's senseless to run about bashing any other machine that might step on the
: >>toes of the one true God you worship (Commodore :) ) all on the preliminary
: >>information...
: >
: >Give me a large break. As I have pointed out many times, I was in this
: >business long before there *was* a Commodore, I programmed for Ataris
: >and Apples long before I ever came near a Commodore product. Did you
: >notice, *anywhere* in the postings I've made about the Jaguar, *any*
: >reference to Commodore, IBM, Apple, or any other company besides Atari?

: >You did not, and you will not. Get off this "one true God" thing - it
: >ain't so.
:
: So if you are so fair, why are you trying so hard to find something wrong
: with the Jaguar right this minute as opposed to waiting and seeing what happens
: when it ships?

Perhaps he's an engineer and not keen on marketing hype being spread around.
As an economist, I cringe everytime I see a politician waving around some
new policy that's going to fix everything. It's never that simple.
As a civil engineer, I cringe everytime somebody says that our national
highways are able to cope with speeds >100kmh. Many of them are over-
engineered.

There have been lots of Amiga specific products, like Video boards that
have their specs scrutinised and found to be very rubbery.

: Well, actually, it does make a difference. As an ex-Commie, you would be
: biased, I would imagine. If you parted with C= on bad terms, I would take
: anything you said against their products with a grain of salt. If you
: seem to be overly happy with them, your prior affiliation w/ Commodore makes
: it questionable as to your possible bias. That's why I personally would
: question your objectivity and motives in regards to the Jaguar.

Any your objectivity isn't into question Flip?
I don't see an "Atari fanactic at large" disclaimer on your postings.

: Of course, as you said, it is my (and any other reader's) problem to read
: between the lines to figure out why you feel a need to try to rain on the
: Jaguar parade.

Maybe it's healthy skepticism?

Or is the truth getting a bit close? People have worked through the
it's the 64bit risc chip that's the cpu, not the 68000 scam. Lots of
other holes to be poked.

: (or the equivelant) on both systems

Because no such thing exists for the Falcon. Due to their architecture,
and the layout of their memory map, all motherboard ram is "chip" ram;
the only way to add ram is by adding a processor on the other side of
their expansion slot, which allows you to pass over the restrictions
they've made on their motherboard design.

In a sense, the only way to get fast ram is to do what was done with old
2000 systems--add ram local to the processor on a processor card.

: Do all tests in various screenmodes to see what effect using
: hi-res non-interlaced screens has on overall performance.

This part is extremely important. Both systems are limited by the
bandwidth taken for the screen representation.

3DO quotes 64pix/sec and since the 3DO has 24-bit graphics, to claim
that this is "for max depth operations" would imply 192 Megabytes/sec,
which is obviously WAY beyond the capacity of the 3DO's 32 bit bus. So
then, what do we assume the "64pix/sec" figure for the 3DO to be?
Obviously, it is the speed for some lower resolution than 24bit... let
me guess: the lowest resolution the 3DO supports. The Jaguar has more
gears than the 3DO.

Simple analysis shows:

```
Jaguar 3DO
--------------+------------------------------
Bus Width | 64 bits 32 bits
|
Rendering/ |
Animation | 850+ Million 64 Million
Speed | pixels/second pixels/second
|
Bus | 106.4 60
Bandwidth | Megabytes/sec Megabytes/sec
```

850Mp/s / 8p/b ~= 106.4Mb/s (b=byte,p=pixel,s=second)
64Mp/s / 1p/b ~= 60Mb/s

ie. the 3DO figure is for 8-bit (256 colour) display. My guess is that
this is the minimum resolution of the 3DO.

So, Jaguar:

```
Render Speed | 106+ Million
in 8bitplanes | pixels/second
```

Happy?

I do not think it has yet flopped, having said that I do not think it is a good seller. I did a phone around and I was told that the biggest seller was selling at 20 or so a week and the slowest said they hadn't sold any for months. I ran a credit check on this last company and they had bad debts, so it could have been that the distributor refused to supply them. Anyway, the message was ``they are shifting...but slowly.''

A sad truth. Not to worry, I have the software I need for the moment. And you never know, I might become a developer myself if my budget stretches that far.

>Chip+Fast ram configurations

It is all very well doing a set of standardised benchmarks like sieve, fib etc, but these suffer from the usual problems of not taking into account any of the architectural advantages of a system. Any benchmark you compile under GCC is not going to take into account factors such as the DSP. Do an integer or fixed point number crunching benchmark on the DSP, and you might find that it will attain a _slightly_ better performance than the 68020 in the 1200 or the 68030 in the Falcon... :-)

Benchmarks will always ignore a lot of powerful aspects of varying architectures.

I don't think you get a fair comparison of the Falcon's _potential_ power unless you do _some_ benchmarks that use the DSP - it's almost certainly the Falcon's main advantage. Of course this means that some poor soul would have to write said benchmarks... :-)

That's why a blanket statement like "The A1200 is 15 percent faster than the Falcon" is almost certain to be incorrect. Faster at some things perhaps, but you can't just conveniently ignore areas where the Falcon's performance is significantly better. The DSP can absolutely _flatten_ the 68020 or 68030 for number crunching, giving the base Falcon the _potential_ to be several hundred percent faster than an A1200 for some number crunching applications...

Other than this, I am interested to see the results, but if they are carried out in the matter described by you above, then I think it should be realised by all that they are by no means a definitive representation of the power of the two systems...

Cheers

>> chip-chip
>> CPU-CPU
>> (or the equivelant) on both systems

>Why? I think you want to do this "extra-memory-benchies" just to show that
>the A1200 is faster in this specific task.
>Hm... Well... post the code you want to test... we will see.

No I want to do these as they are important to the Amiga system.
As the Falcon is effectively all `chip-ram` it is immaterial on that
machine. Chip-ram will be slower than Fast so its important to see
how quickly both can be moved. Its also important so see how quickly
we can blast data into chipmem. (maybe not so interesting for F030
owners though)

>> Then try moving memory around the chip space with the blitter.

>Ouh, this is hard, because the blitter is mostly used with a VDI-call.
>(Bitblt). I doubt that this is good for comparison.

It should give an idea of the capabilities of the system
blitter. Should settle a few more arguments I think...

>> Do all tests in various screenmodes to see what effect using
>>hi-res non-interlaced screens has on overall performance.

>Ok. No problem. I suggest the following:
> 640x480 with 2 colors and 60 Hz
> 640x480 with 16 colors and 60 Hz
> 640x480 with 256 colors and 60 Hz
> 800x600 with 16 colors and 72 Hz
> 800x600 with 256 colors and 55 Hz

> 320x200 with 65536 colors and 60 Hz

Yes, I detect a bit of bias creeping in. I suppose on the amiga
we could use a 320x200 with 260000 colours at 60 Hz or even try a
few 50Hz screens as they are important to PAL owners (the F030 can
do proper 50Hz PAL screens?)

I suggest
320x200 in 16 colours at 60 Hz (and x256 at 50Hz)
320x200 256 60 "
640x400 16 60 interlaced "
640x400 256 60 non-interlace "

As these are the most likely to be used modes.
The same resolutions/framerates could be used with 65536 and
260000 colour modes as well.
If you want, we could try 1280x512 50Hz in 256000 colours or the
equivelent F030 mode...

There would be a lot of tests but think of all the bandwidth on
the advocacy gropus saved!

>> Also, A1200 would have to be done for both Chip only and
>Chip+Fast ram configurations

>Errh... is FastRam build in the standard A1200 models? Hm...

No its not, but for the cost of a 1 meg F030 I could have an
A1200 with an extra 4 megs fastram (and HD) - see the post that
started this thread ;-)

>when accessing ST-RAM).

Why is the bus 64 bits? Surely the CPU can only grab 32 bits in
once access??

>simple.

Weve been using a proper, robust operating system on the Amiga
ever since it came out. In all that time all ST owners have ever
said was "we dont need multitasking as we havent got it". In the
past couple of months the ST (in the form of the F030) gets a
multitasking OS and you think you can use it to bash a system which
has 8 yrs+ developement work in it?

Get real! Once your multitos can mactch the Amiga OS for faetures
THEN complain.

*You* did. Most people *dont*. Thats one of the reasons for the
relative lack of success of the Falcon. It has too many things that
most people dont need, or dont need right now, bumping up the price.

>> As you say, the F030 is 2x price of A1200. That means you can buy
>>an awful lot of extra add-ons for the A1200 to make it functionally

>pocket I couldn't justify it to myself.
>>Gavan

Take a look at the original posting for a blow-by-blow pricing of
the F030 vs A1200. I assumed that an A1200 costs 300 UKP and an F030
with 1 meg/no HD 600UKP. (Thats what I saw it advertised at in a
music mag - maybe dedicated computer stores would knock a few pounds
off the price)

I hear than you can also get a 4 meg/80 HD F030 for around 1099
UKP. Compare THIS with an A4000/030 with the extra spent on fastram.

F030 A4000/030
1099 899 + 160 (difference buys you 4 meg fastram)
4 Meg 6 Meg : 2 chip/4 fast
80 Meg IDE(?) 80 Meg IDE
16 Mhz 030 25 Mhz EC030
with MMU no MMU
Yukky ST box Proper case with expansion slots

16 bit sound 8 bit sound
with DSP no DSP
LAN no LAN
SCSI no SCSI

The F030 has an MMU (not very useful to most Amiga owners)
It also has the 16 bit sound/DSP and LAN and SCSI ports. The
SCSI is nice but not most people could survive without it for a
while. The LAN is practically useless for most people.

The A4000/030 offers (I would guess) at least 300% the CPU
performance of the F030 given the limitations of the F030 memory
access. It also has 50% more RAM and proper expansion capability via
the Zorro III slots making quite a bit more expandible than the F030

Oki, now cut out a piece of the picture on the screen and move it around...

The Falcon can do it, the Amiga1200/4000 *CAN'T*.

Sky One TTV

GM> In the UK the base configuration is 1 meg. It may be different

Nope, according to Atari the Falcon baseline is 4Meg RAM and 65Meg HD, though all Falcons come with 85MB HD nowadays.

There ARE Falcons with less memory/no HD, but they are for EXPANSION. No programmer on the Falcon sees 1 Meg as the limit, we all use 4.

Na! I just love this little discussion about what constitutes a thirty-two bit processor. There are really two camps 1) must have 32 bit access to memory, and 2) must be able to perform 32 bit integer math in one operation.

Since I already new that CD32 is A1200 based (68ec020), not A500 (68000), I couldn't resist fanning the flames a little more. Besides now that every one has it out of their system things seem to be a little more sane here, though Gavan is trying to re-kindle the A1200/Falcon debate again.

Brian

btw: Does Dave Bucceiro (Spelling?) still work there? He was working in the Rochester office. He and I used to work at Lockheed Sanders, I lost touch with him a couple years ago.

No, 260000 colours with 64 base colours. Get your facts straight.

**********

Subject: Re: The Jaguar..

>GM> As I answered in another post, you can go straight from white to
>GM> black provided the base registers are set right.

>And as I wrote - WOW .. you mean you can choose from 64 colours? Wow .. I can
>only choose from 65536 ...

as above, actually I can CHOOSE from *16 MILLION*

>:-))) .. Most demos on the Falcon are in TRUE COLOUR .... NO SLOWDOWN ..
^^^^^ ^^^^^^^^^^^^
demos : cool to look at but not terribly useful. I doubt many Falcon demos
could match the best of current Amiga ones..

TRUE COLOUR is **24 bits** not 16 bits. Neither the F030 or A1200 have
true colour as standard. The A1200 comes closer with MORE colours on
screen at higher resolutions with a full 24-bit pallette

no slowdown - from what?

>There ARE Falcons with less memory/no HD, but they are for EXPANSION. No
>programmer on the Falcon sees 1 Meg as the limit, we all use 4.

oh. and the A1200 is not for EXPANSION? No A1200 owner seens 2 meg as the
limit. You can expand to 10 meg or better still buy one of the many 030
accelerator cards and give yourself a 50 Mhz 030 with proper 32 bit RAM
exclusive access. This would ***BURN*** any Falcon.

another post;

>GM> Yes, there are really lots of games that use the 65535 colour
>GM> mode on the Falcon, arent there?

>Possibly, since most demos use that mode. (It's SOOO wonderful setting ONE pixel
^^^^^^^^
Ah, reality starts to set in. At least you are starting to recognise
that most of what you rant on about is speculation and possibility.
Its a start....

>GM> The point is, these modes are useful for displaying static pics.
>GM> 256 colours is more than enough for games (look at project X in 32
>GM> colours on the Amiga)

>:-) .. 256 colour games is old technology.

Not on the ST or Amiga. Maybe PC owners could claim that, but I dont see
many >256 colour PC games despite there being a reasonably large number of
PCs with the hardware to display >65536 colours. (Relative to the ST/Amiga
that is)_

See an Amiga running Project X or Alien Breed sometime to see what you can
do in 32 colours. Then tell me that 256 aint enough.

>And? I can make shadebobs in 65536 colours .. :-))) .. Try that in your beloved
>HAM8 .. haha ..

I prefer having a social life.. Seriously, its fun making these things but
they dont do anything. If you are a good demo coder maybe you will go on
to make money programming games, but not, I think, on the F030.
**********

A1200 15 pc Faster than Falcon?.. and lots of others too;

>GM> just what is the Base? Here it is 1 meg, no HD. Can Falcon
>GM> owners from Europe and America give a definitive statement.
>GM>
>GM> If the base is 4 meg/80 HD then I can get even more of an A1200

>Why should you? The base is 4/65. All Falcons nowadays are 4/85, though you CAN
>get Falcons without HD or with 1 meg memory. According to atari they're for
>EXPANSION only though.

my original post was based on a F030 with 1 meg/ no HD costing 600 UK Pounds. I saw it advertised in a music mag at that price. Can a UK owner please post how much a typical 4 meg F030 with a HD would cost. I can then compare it with comparable amiga setup.

eg. A1200 300 UKP. (2 meg chip, no HD)
+GVP A1230 400 UKP. (030 at 40Mhz, 68882 at 40 Mhz, 4meg RAM)
+IDE 80meg 160 UKP. (80 meg 2.5' IDE drive, from PC)
---
total 860 UKP. for 6 meg, 40Mhz 030 +FPU, 80 meg HD

There are other options: 50 Mhz 030 cards with added SCSI-II (fast) interfaces cost about 600 UKP. There are LOTS to choose from.

Or you can stick with the 020 and save money by going for just a 4 meg Fastram expansion at ~165 UKP. This may or may not be 15 % faster than the F030 anyway - somebody do the benchmarks!

OR go for an A4000/030 or 040. You _can_ get a Falcon with 040 cant you? :-)

>Hard facts: DMZ (a Commodore paper in sweden) stated that *5000* A1200s had been
>sold here. (And that Commodore is dead BTW)

I havent seen much in the way of hard facts from you before so I have to doubt this info until I see a more reliable souce .. Marc Barrett maybe ;-) NOT!

>GM> Most intelligent Falcon owners stick to arguing about the strngths
>GM> of their machine.

>So do I .. :-) ...

I`ll leave that one up to intelligent people to decide..

whoops, missed this one in my last mega-long post....

rickard.troedsson@troed.ct.se (Rickard Troedsson) (the Swedish Lunatic)
writes ...

>GM> You can get SCSI for the A1200 too. You pay extra, but an A1200
>GM> with SCSI would still be cheaper than a falcon. Oh, and there are
>GM> device drivers available for all the SCSI add ons?

>Jupps.

>Using Kodak-Photo CD for example ... have the A1200 got that? [laughter]

sorry, has Atari licensed the technology? I gather you have to pay
Kodak to use the `Photo CD compatability` banner with your system. I
know utilities exist to read and convert photo CDs on the Amiga and
other platforms. But I dont think anyone apart from apple has yet
licensed the photo CD mark.

You ideally want a multi-seesion drive and fortunately the CD32
has this (The double speed would be handy too for spedier loading)

Come to think of it, does Atari have any CD product available?
The jag is supposed to have a CD *add-on* but not as standard??

>GM> superior to the F030 for the SAME PRICE. Read my point by point
>GM> comparison in the original posting to see what I mean.

>You missed approx. 99% of everything in that one ..

I dont think so. You certainly didnt present a convincing counter
argument. Maybe a more thoughtful F030 advocate could present a
coherent response to the original post?

Gavan.

>GM> Where is the 2 meg RAM, 600 MEG storage, 32 bit CPU blah ..
>GM> blah.. of the SNES?

>Doesn't need it since it's graphics engine is FAR superiour. I have a SNES and
>there's NO WAY I would trade it for an *EXPENSIVE* Cd32.

Dont have it, dont need it, eh?
I would suggest that it doesnt have the main memory and display
abilities to take full advantage of a CD ROM drive. Perhaps thats why
nintendo plan to bring out a 32 bit CD console (like the CD32 but
potentially a lot better) in 1995 (!!!!!!!)

> *EXPENSIVE* Cd32.?

At 299 UKP (less from discounters) a 32 bit console with 2 meg memory
and a double speed CD drive represents amazing value for money. Much
better than the shitty Mega CD. A SNES costs around 90 UKP without game
here, but when the games cost 50 UKP + you begin to realise what a ripoff
it is. All that money for a 2 megabyte game! (Console pushers quote
megaBITs to fool the kids).

Of course you probably have the pirate disk adaptor. I see plenty of
SNES/MD sites on the pirate FSP sites and bulletin boards. You probably
dont get ripped off like most of the population does. Then again, you
might just be stupid enough .....

>GM> believe I`m even arguing the point! You really thing Amigas are
>GM> inferior to EVERYTHING dont you? I bet you would buy a ZX81 before
>GM> an A4000!

>I would think about it. The only thing I want in an A4000 (040 model) is the
>processor .. that's it ..

Exactly, the Falcon cant be bought in anything but the basic 16 bit
crippled 16Mhz 030 version. Somewhat limits your horizons doesnt it? Atari
would need to get out a full 32 bit 040 falcon if they want it to have any
credibility as any sort of serious computing platform.

Ah, finally a topic of interest. You know, I think the RX7 is nice and
all, but it is just too small for my taste. It gets excellent performance
with only 255 hp, but that's to be expected in such a small size. Similarly,
a Porsche 911 Turbo will beat just about any other street car, but it is so
much smaller than, say, a Viper. I'm not saying I wouldn't want the Porsche,
but I'd take something like the 320 hp, 94 Stealth R/T Turbo over the Rx7.

>Or I can say that my Amiga 500 outrenders a SGI system, or a CRAY YMP

>games newgroups then.
>
>If you're posting specs in any sort of .advocacy newsgroups, then be
>prepared for some scrutiny.

Until I see the "fun" spec, I'm still not convinced that any of these new game machines is better than an old SNES. Lots of hardware specs don't mean much. Maybe one machine has this cool game allowing you to calculate a spreadsheet in one microsecond. Oooo--fun.

>>First you admit that the Atari beat the '486 on a benchmark, then
>>you say you'd like to see evidence of a benchmark showing a '486 being
>>outperformed by an Atari. Isn't that being rather inconsistant?
>
>No. You didn't read very carefully.

Sure I did. I was pointing out that the Atari had beaten the '486 on a benchmark. When this happens, most MS-DOS users tend to ignore the result, then ask the same question again. It's nice to know you weren't doing that. :-)

> And if
>you are so sure the Atari is faster, why didn't you cite another
>benchmark besides your Mandelbrot test?

The Mandelbrot test was the only one reported from CeBIT in ST Informer. In another posting here in *.advocacy, I've noted that a comparison test of various platforms by Byte Magazine would be worthwhile. Would you like to suggest it to them?

>Well, maybe that's how things work on this newsgroup, but everywhere
>else people know what PC means. Why do such publications as "PC
>Magazine", "PC Week", "PC Sources", "PC/Computing", etc. etc. all deal
>with only Intel-based machines?

Advertising dollars greatly affect the coverage of a magazine. Any editor who notices that 80% of paid advertisements relate to MS-DOS machines is *certainly* going to ensure that 80% of editorial coverage relates to that specific machine. Other advertisers will feel lost in the crowd and leave, so that only information that is specific to one platform remains.

Next question?

> Even if
>you don't agree with that, to call them MS-DOS machines is ridiculous,
>given the fact that the number of operating systems for the 80x86 line
>numbers in the double digits.

You have a good point. I've always had difficulty referring to them as "Clones" or "P/Clones" (just doesn't sound right), and it never seems fair to call them "Intel Boxes" when Cyrix and Advanced Micro Devices are also major players. The only truly dominate feature of these machines is the fact that a massive majority of them run MS-DOS,

even if it's just as the underpinnings to Microsoft Windows.

>>>What software?
>>
>>For starters, I listed the software running on my machine.
>
>What do you mean "for starters"? Doesn't that imply there is more to
>list? If so, why didn't you do so?

A) I'm trying to cut down on the bandwidth,
B) I was only listing the applications I use on a regular basis.
Other Atari users can probably add to this list.

>Only if you assume that because your current software runs on your ST
>then software 3 years from now will run on your Falcon. Then again,
>that's probably how long it will take for Atari to use a 68060 in
>their systems...

That is the whole point of the GEM operating system -- it is a standard way for a program to operate with the computer. A program written to run gracefully with GEM will continue to run as newer versions of the hardware and operating system are released. Microsoft has only belatedly offered the same thing in Windows.

New Falcon software will run on existing ST's (minus the Falcon-specific features), and existing ST software will run on Falcons (but will be unaware of Falcon-specific features). There will always be _some_ incompatibility (nothing is ever 100% in computing), but I've heard in one comp.sys.atari.* newsgroup that 80% of GEM applications are running on Falcons (subject to update!)

>> It's an indication that Atari users are not as subject to the
>>"planned obsolescence" that's so prevalent in the MS-DOS world.
>
>Well, in three years when the Motorola 680x0 line is totally obsolete,
>where will you be? Still running all your software on an ST? How
>impressive will that be?

I spoke with a Motorola technical representative today, and learned that there are no plans to phase out the 680x0 series in the next three to four years, and that they will be expanding the uses of the existing architecture.

If that's not impressive, then look again at the title of this thread: Atari vs. the EXPENSIVE world of DOS. Atari has made an effort to maintain compatibility throughout it's line and has minimized obsolescence of their machines. You don't see that in the MS-DOS world (i.e., you wouldn't try to run a Windows-based application on a '286), and that's why the Atari is the better machine.

Ok, I can accept that you think that, and I don't think that I can make
you change your mind.

Here's what *I* think: proper memory protection is only needed in proper,
robust MULTIUSER multitasking operating systems. UNIX is a perfect example.
In single-user systems, it's a "neat" feature for program development,
but in no way essential for the casual user. AmigaOS is a perfect example
of this; I haven't experienced a single crash during the last three days
(I know because all reboots are logged). I have been doing a great deal
during these days, polling FIDO systems for mail, running UUCP, calling
the university several times per day, working on the SEGA port of
`Superfrog', working on LhA V2.0, networking with my A3000, and much more.
I don't need any memory protection.

>will take twice as much time to fetch data as a 68030 on a 32-bit bus.
>

Stephan, you are forgetting one very important point. In a lot of real world applications, you are going to have a cache hit. Caches are designed to have the highest hit rate possible in real world applications.

Therefore, in the real world, the 16-bit bus does not "cripple" the Falcon030 as much as you guys are claiming it is.

This is the main point I was trying to make all those months ago in comp.sys.amiga.advocacy.

By your logic, my 16Mhz 68000 AdSpeed accelerator in my Mega ST4 is "crippled" because for every cache miss it has to slow down to talk to slow memory designed for an 8Mhz 68000.

And yet this "crippled" machine can unarc files approximately twice as fast, can redraw DTP documents twice as fast, can spell check text files twice as fast...etc.

Sure, using a real 32-bit bus would have been better. But the Falcon030 design is not as bad as you guys are trying to make it. It really is a nice little machine.

|>
|> Xavier
|>

The 15% faster that the A1200, accessing optional 32 bit memory, versus the
Falcon accessing 16 bit memory. Both systems have 32 bit ram capability,
both as options. The A1200 option is one heck of a lot more convient.
As Gavan has pointed out in the UK, at least, it is financially correct
to compare a base Falcon with an upgraded A1200. (I'll take his word for it!)

The pipeline CAN make up for this difference, provided the compiler and
programmer understand it. And do not forget the Falcon has a 11% faster CPU
that will make up some ground lost by the slower memory accesses, maybe even
giving the Falcon the lead if the caches are enabled :)

If Atari had created a 32bit syncronous memory path from display ram to the
68030 then the Falcon would be 38% faster at memory accesses than the A1200.
But that would not mean the Falcon would be 38% faster there are a lot of
factors inside the 68EC020 and 68030 that would govern the difference in
performance.

And even if Atari had the 32bit syncronous memory path there would still be
pissing and mouning about the Falcon by those that have performed selective
reading, it may be a different group it may not, but it would most certainly
include Marc Barret, and BobR. (though Marc has been quiet here for a while,
and Bob would just say any MAC is better because it's a MAC :). Admittedly
most A1200 owners will purchase extra memory, to get more memory not the 32 bit
accesses.

I think we beat this subject to death a couple months ago so let's have
everyone that is even slightly interested in the subject read the old posts.
These are very comparable machines that will run neck and neck with eachother.

I hate quoting William Shatner but...
Get A Life People...

You never cease to amaze me, Rickard. How can a "superior" graphics engine compensate for lousy data storage capability and an absolutely PATHETIC excuse for a microprocessor (the 65816) ? The limiting factor when you produce a game for the SNES and SEGA is the small amount of data you can squeeze into a cartridge. With some kind of secondary storage you would see *much* better games (at least sonic- and graphics-wise). With a better processor, you would see more complex games (there is only so much you can do with 128K RAM and three core registers).

>I would think about it. The only thing I want in an A4000 (040 model) is the
>processor .. that's it ..

That isn't hard for me to imagine. Especially since there's no way to get one of them into that wonderful bird of yours.

>I would; I'd rather have 12M of RAM and a decent display, like
>800x600x16-bit).
>

This is the typical output from PC users. Brute force is prefered over
elegance at every turn. If the problem requires a bit of thought
hurl more hardware and a faster CPU at it.

This sort of attitude is almost unique to the pc/msdos/windows platform.
Nowhere else are such sloppy standards elevated. Indeed rewriting code
to optimise the resources of a machine has been a `noble' task since the
ZX81.

Talking of improving code, have you noticed how the features offered by
the pentium will not be used because lazy software houses are using the extra
speed to get performance rather than optimised code?

Of course you haven't.

>Software will never be available for the Falcon.

Never is a long time.

>> Because Atari programs are more compact then their MS-DOS equivalent,
>> an 80 Megabyte hard drive gives space equivalent to 240 Megabytes on
>
>You really are dreaming. A good word processor, with lots of functions,
>takes up lots of space on any platform.
>

Well, that is wrong as well. Good word processors have been around for
*years*, with lots of functions that can run very well thankyou from
a 286 or 68000. I hate to think what people used to do in those far off

days of 8 bit computers.

Try thinking ``The built in obselesence of the msdos machines and the sloppy coding practices does not mean that all platforms are the same''

It os a bit long, but I'm not trying to undo the brainwashing you suffer from.

>Obviously, you can say, "My computer does all I want it to!" and I'll
>say, "Yah, eventually." I guess you don't care that Calamus isn't
>running terribly fast, or that your spreadsheets take a long time to
>calculate. Me, I don't like to wait for my computer.

Then you are a fool. Whatever gets the job done is enough for the job. If you don't have the maturity to wait for a result then you deserve PC kludgeland.

Sure is convenient... it's already on the motherboard! Contrary to
mistaken common belief, the RAM on the 1200 _IS_ 32-bit RAM. The
slowdown comes from contention with the custom chips, but it is
all accessed in 32-bit chunks.

>As Gavan has pointed out in the UK, at least, it is financially correct

cmedley@wam.umd.edu ('Flip') writes:

>What you said was that they were saying things about the Jag specs that
>are inconsistent. If everything they say is factual (i.e., TRUE) then
>there would be no inconsistencies.

Not true. There are many ways to bend truth to suit your aims. Any
even superficial study of advertising techniques can teach you this,
as it's standard advertising usage. There is every chance that the
Jag's specs are *basically* as Atari has represented them. There is
also every chance (and, in my view, almost a certainty) that those
specs do not reflect any reality that the applications or the developers
will be able to use.

>I wouldn't know. But I will say this... when the C-64 was "large and in
>charge" you could walk into ANY computer store and see software and accessories
>for it.

Boy, *that's* one of the exaggerations of the century. Around here
(and I think you'll agree that if there's anywhere in the country that's
likely to have computers on every streetcorner, it's the SF Bay Area)
you had to hunt very hard to find a C64 in *any* computer store other
than the two or three who specialized in Commodore. You could find them
in K-Mart and Target, but computer stores? No way!

>You sure can't do that with the A500, which incidentally, is no longer
>available.

Then why'd you bring it up? :-)

>>So who's flaming? Or does any discussion where there are disagreements
>>count as flaming in your book?

>When someone runs around picking "fights" because they feel a need to prove
>the superiority of their computer purchase to reduce their own cognitive
>dissonance. :)

Hey, slow down and engage you brain, please. *Nobody* is trying to prove
the superiority of their purchase, here - you can't buy a Jaguar, now
can you? And if trying to interject fact into a discussion consisting
entirely of parroted Atari hype is "picking fights", then it's hopeless,
eh? Not to mention paranoid.

>So if you are so fair, why are you trying so hard to find something wrong
>with the Jaguar right this minute as opposed to waiting and seeing what happens
>when it ships?

*You* are the one who has defined what I'm doing as "trying to find something wrong". Hey, buddy - that's *not* what I'm doing. What I'm doing is trying to find the things that are *right* about the Jaguar, and what I'm saying is that it's impossible to do that as it stands. Then I'm trying to say what I *think* those impossible specs *actually* mean - that's a far different thing than either of the things you accuse me of doing. In point of fact, it seems to me that you're much more guilty of picking fights than I am - I've attacked bogus specs, you've attacked *me*.

>>And, if you're going to be so quick to come down on *my* head for
>>speculating about the Jaguar, why don't you come down equally hard on
>>those folks whose postings I'm rebutting - the ones who are all over
>>rec.games.video raving about the wonderful Jaguar, based on exactly the
>>same information (or lack of it) as I have?

>I don't read rec.games.video. :)

So just read comp.sys.atari.advocacy - many of the articles are well and thoroughly crossposted (as is this one :-)

>Well, actually, it does make a difference. As an ex-Commie, you would be
>biased, I would imagine. If you parted with C= on bad terms, I would take
>anything you said against their products with a grain of salt. If you
>seem to be overly happy with them, your prior affiliation w/ Commodore makes
>it questionable as to your possible bias. That's why I personally would
>question your objectivity and motives in regards to the Jaguar.

Well, you, personally, haven't the slightest idea what my biases or past experiences are, with Commodore *or* with Atari. So why don't you try a basic tactic: presume that I'm speaking as objectively as I can, and go from there? Why do you presume that there must be some Commodore bias because I'm dissing Atari? Why don't you presume (as you should, because it's true) that I diss Atari because they deserve it? And why don't you check to see if I diss Commodore as well (which I do when *they* deserve it)?

>Of course, as you said, it is my (and any other reader's) problem to read
>between the lines to figure out why you feel a need to try to rain on the
>Jaguar parade.

Yeah, because you're too damned paranoid to read the lines as written. I think I've been pretty upfront about why I feel the need to bring some fact into the argument. It isn't raining on someone's parade, it's pointing out that the "parade" is fake. I'm not obliged to fall into line behind the Atari faithful, just as I'm not obliged to fall into line with anyone else's propaganda. And if you don't like it, that's *your* problem, not mine.

>Stephan, you are forgetting one very important point. In a lot of
>real world applications, you are going to have a cache hit. Caches
>are designed to have the highest hit rate possible in real world
>applications.

Caches are designed to have the highest hit rate possible given
design and costing constraints. I`m not sure what size of cache the
68030 has but i think its 256bytes Inst, 256bytes Data. Thats not an
awful lot of cache memory and, although it will speed up operation
of the chip, I would imagine it has quite a high miss rate. Dont
forget that when you start to use multitasking, the priciple of
programs tending to call memory close to them goes out the window as
you may be dealing with several processes scattered over main memory.

I wouldnt put too much faith in the ability of the 68030 cache to
provide a high hit rate. Intel only claim 90% with a 486 and thats
with 8K of cache (and running a single tasking OS I imagine).

>By your logic, my 16Mhz 68000 AdSpeed accelerator in my Mega ST4 is
>"crippled" because for every cache miss it has to slow down to talk to
>slow memory designed for an 8Mhz 68000.

It depends on your memory access but I`d say that it is probably
running at less than its possible maximum. An A1200 running a 68020
at 14Mhz far outperforms an A500 running a 14Mhz 68000 because of
the 32 bit bus access (and cache!)

>Sure, using a real 32-bit bus would have been better. But the
>Falcon030 design is not as bad as you guys are trying to make it. It
>really is a nice little machine.

It is, but unless Atari wake up and address some issues like
pricing and making an 040 available, it must surely be doomed in the
long term.

Fair enough. So wheres the photo-CD add-on drive for the Falcon.
I dont see Falcon photo-CD players, do you?

Maybe Atari licensed it for the Jaguar CDROM ? It would make
sense to have photo CD for a platform that actually came with a CD
player!

So far, the world isnt crying out for photo-CD, so its not
really a disaster that neither the F030 or the Amiga currently offer
it. I suspect that C= didnt pay for photo-CD for the CD32 simply to
keep the costs of the player down. Its got all the hardware needed
to display photo CD images and also has the multi-session drive
needed to get the most compatibility. All it would need is for C= to
produce a photo-CD software disk at a later date. Alternatively,
Amiga computer users could use the photo-cd to ppm converter on
Aminet to access photo-CDs. I think C= are playing wait-and-see
before they pay to put a photo-cd sticker on their players.

>In single-user systems, it's a "neat" feature for program development,
>but in no way essential for the casual user. AmigaOS is a perfect example

Thats about right. You only need memory protection if your
software is going around munging other programs. ie Your software is
faulty. Or, you are developing programs in which case bugs in your
code can cause problems. I`m not into heavy amiga developement but I
gather that programs like enforcer and mungwall can test for such
illegal memory access anyway, so whats the problem? Properly written
software wont cause crashes.

Of course, its nice to have security but memory protection still
wont stop a faulty task from crashing and losing data.

rickard.troedsson@troed.ct.se ( >> CRAZY << Rickard Troedsson)
^^^^^^^^^^^ my addition

writes...

>GM> No, 260000 colours with 64 base colours. Get your facts straight.

>Well, since I would like to KNOW what colour a pixel gets when I try to paint,
>I'll stay at 64 colours.

I`m glad you have an artistic ability. Most people stick with
hi-colour graphics as an image display buffer. If you are so
artistically inclined maybe you should get a true 24-bit paint
system from somewhere, as SB points out that nearly ALL professional
work is done in 24 bit and downconverted.

>aybe not design, but have you seen Termfin? A DSP rotated/stretched/zoomed true
>colour area, where the 68030 displays different colours/graphics all the time?
>(And Playing a 50Khz 16bit sound)

sounds good, if only I could find someone with a Falcon to show
me.....

>GM> TRUE COLOUR is **24 bits** not 16 bits. Neither the F030 or A1200 have

>Sorry, True Colour is by DEFENITION a graphics mode WITHOUT a palette, as in the
>Falcons 16bit mode. (We have 18 bit if we stay in 256/16/4 col mode)

No, true colour is ***24 BITS**** Otherwise I could claim true
colour from a 256 colour quantised 8-bit mode.

>GM> oh. and the A1200 is not for EXPANSION? No A1200 owner seens 2 meg as the
>GM> limit. You can expand to 10 meg or better still buy one of the many 030

>Are you stupid or just trying to be? You were trying to imply that the base
>Falcon is 1 Meg, that would mean that programmers wouldn't make applications
>that needed more than 1 meg. I then explained to you that 1 meg isn't the limit,
>but 4.

Any program written to be OS legal can use as much memory as is
available on the system. This is true for almost any modern
computer. I`d say that games writers will see 2 meg as a limit for
most arcade type games. Thats hardly a major problem. I`m not saying
that F030 applications wont use more than 1 meg, just that if you
lash out for a 1 meg F030 you are likely to be limited by that one
meg until you upgrade. Anyway, that wasnt what the original point
was about.

>GM> accelerator cards and give yourself a 50 Mhz 030 with proper 32 bit RAM
>GM> exclusive access. This would ***BURN*** any Falcon.

>That isn't as fast as the DSP. I think you're burning yourself here.

A DSP can do certain things very fast. Its not the CPU though and is
unlikely to be able to run a C compiler or a spreadsheet or any of
the sort of things that benefit from increased CPU power.

>GM> See an Amiga running Project X or Alien Breed sometime to see what you can
>GM> do in 32 colours. Then tell me that 256 aint enough.

>Don't play games on computers, I have a console much better at that.

yes, you have the typical console owner mentality. I prefer to have
a system I can play games on, and code, and use applications. In the
future, I may even want to watch FMV disks all on the same system.

>Yeah well, I haven't been doing demos for 3 years, during that time I got hired
>as a systemprogrammer for a local company here .. I'm NOT making demos.. :-))

they let YOU loose on a business system???

>one? The only difference from the A1200 is the faster processor, the rest is the
>same ... lousy sound/graphics ..

And a one meg F030 is twice the price of an A1200 in the UK. At
least with an A1200 you can use the extra dosh to make a superior
system. Apart from add extra ram and HD, you cant give the Falcon
an 040 to match the A4000 for processing power.

>Well, I gave you my source. The most recent DMZ has two pages about how bad
>Commodore is doing and that they're VERY close to bankrupcy.

You can connect any SCSI CD-ROM drive. Then run one of the programs that can read
PCD files (ColorDisc, Gem-View...).

"some processing" ... it's easier to say "Impossible without severe hacking"

GM> No, 260000 colours with 64 base colours. Get your facts straight.

Well, since I would like to KNOW what colour a pixel gets when I try to paint,
I'll stay at 64 colours.

GM> demos : cool to look at but not terribly useful. I doubt many Falcon demos
GM> could match the best of current Amiga ones..

Maybe not design, but have you seen Termfin? A DSP rotated/stretched/zoomed true
colour area, where the 68030 displays different colours/graphics all the time?
(And Playing a 50Khz 16bit sound)

No Amiga has the POWER to come CLOSE to that!

GM> TRUE COLOUR is **24 bits** not 16 bits. Neither the F030 or A1200 have

Sorry, True Colour is by DEFENITION a graphics mode WITHOUT a palette, as in the
Falcons 16bit mode. (We have 18 bit if we stay in 256/16/4 col mode)

GM> oh. and the A1200 is not for EXPANSION? No A1200 owner seens 2 meg as the
GM> limit. You can expand to 10 meg or better still buy one of the many 030

Are you stupid or just trying to be? You were trying to imply that the base
Falcon is 1 Meg, that would mean that programmers wouldn't make applications
that needed more than 1 meg. I then explained to you that 1 meg isn't the limit,
but 4.

You then tell me the Amiga programmers don't see 2 meg as the limit for what a
standard program should use - but 10 meg??? GET A LIFE!

(The Falcon can be expanded to 14 Meg "chip"mem, and unlimited (more than 512)
meg Fastmem.

GM> accelerator cards and give yourself a 50 Mhz 030 with proper 32 bit RAM
GM> exclusive access. This would ***BURN*** any Falcon.

That isn't as fast as the DSP. I think you're burning yourself here.

Yes, but make sure you get a multi-session drive as it offers the
best compatibility.

Anyway, if Atari pay the dosh for photo CD why dont they sell a
system that can run them as standard? ie. A Falcon + PCD package?
If they just buy the rights and then do nothing with them they are
throwing money down the drain. There are precious few Falcons, never
mind Falcons with CDROMS.

Does anyone know if it is illegal to write software to decode the
pictures on pcds without a licence? I mean, if someone was to write
a pcd decodeer and then release the s/w into the public domain as
source, what would happen? I can see s/w becoming available very
quickly that will decode photo-cds on any CDROM equipped system...

CD32 is here now? I can't find one newspaper articale about it (I have 6
about the Jag). I've never seen any TV about it (I saw a report on CNN about
the jag, but alas no pictures). Not one game store has even heard of the CD32
(while all of them have heard of it and only one, KB toy & hobbie said they
don't know if will carry it, while most are ready too).
However I haven't seen any ads for either.
The only propf that I have that CD32 exist is post in Atari Advocacy. If you
happen to know which store in Maryland I can drive too and seen this system
which you say is available *now*, I might be willing to believe it)

>me.....

It _is_ good, as are some of the other Falcon demos I've got. Termfin is
not quite as impressive as one thinks at first, because (and I'm sure Rickard
will correct me if I'm wrong) it is using a line doubled screen mode on an
RGB monitor, so the screen area being manipulated is about (and this is my
best estimate) 160x100 true colour. There is a new version of Termfin, called
Plasma30 that manipulates an entire overscanned screen at 30 fps ( but again
uses line doubling, so the screen area is roughly 384x120).

Well, Rickard, did I get it right?

It is still _very_ impressive to look at (and listen to!), even taking this
into account.

>>GM> TRUE COLOUR is **24 bits** not 16 bits. Neither the F030 or A1200 have
>>Sorry, True Colour is by DEFENITION a graphics mode WITHOUT a palette, as in the

>colour from a 256 colour quantised 8-bit mode.

Oh, no! Not the "What is the definition of True Colour" debate again!
At least if you talk about the Falcon's True Colour mode, everyone knows
which particular mode you are referring to, otherwise we'll have a whole load
of people asking "What is the Falcon 'high colour' mode? I can't get it from
the desktop." :-)

16 bit 'true' colour mode (please note the quotes). Is very nice from my
point of view as a graphic artist. I don't have to worry about setting up
64 base colours each time I want to start a picture, I don't have to worry
whether a pixel will actually be the colour I want it or something close,
and 65535 colour pictures look very, _very_ good. I know HAM 8 pictures can
also look superb, but 16 bit mode (he says avoiding the true colour statement
deftly) is _so_ convenient and easy to use...

A 1 meg Falcon is as much use as a chocolate fireguard, as is a 2 meg
A1200. The screen modes chew memory, and if you want to store any
graphics then that chews more memory. 4 Megs is the minimum _useful_
Falcon, I can't see anyone getting any real use out of a 1 meg Falcon
system. I can't speak for the A1200, but I would expect the situation
to be similar, particularly for games.

Oh, by the way, if you use that chocolate fireguard line out of
context I'll sue your butt off for misrepresentation! :-)

>>GM> exclusive access. This would ***BURN*** any Falcon.

>A DSP can do certain things very fast. Its not the CPU though and is
>unlikely to be able to run a C compiler or a spreadsheet or any of
>the sort of things that benefit from increased CPU power.

Probably correct, but for a C compiler or a spreadsheet you will
certainly _need_ that 50 MHz 030 you mentioned to outperform the 030
in the Falcon. The 1200's 020 probably won't do it, even with 32 bit
access to memory. (I must remember to look up instruction timings for
the 030 and 020 to check where differences lie...)

>>Yeah well, I haven't been doing demos for 3 years, during that time I got hired
>>as a systemprogrammer for a local company here .. I'm NOT making demos.. :-))
> they let YOU loose on a business system???

I note that Rickard uses the handle 'SYNC' in his .sig. If he is the
well known Sync on the ST, then he is a very competent coder indeed (at
least in assembly.) Who better to have doing your system programming
than a highly competent coder? I know that it's a completely different
type of application to a demo, but, believe me, if you can wrap your head
around the sort of problems you need to solve to write a good ST demo, then
programming structured C as part of a large system is a piece of pi**.
(Don't annoy all demo coders out there by saying that when it comes to
writing 'real' code they're all useless, will you... :-))

> And a one meg F030 is twice the price of an A1200 in the UK. At
>least with an A1200 you can use the extra dosh to make a superior
>system. Apart from add extra ram and HD, you cant give the Falcon
>an 040 to match the A4000 for processing power.

Current UK prices (from the September 1993 copy of ST Review)

Falcon 1M no HD 589.99 UKP (only 1 stockist for this configuration - all others had a 4 M Falcon as the base machine.)
Falcon 4M 65M HD 899.99 UKP
Amiga A1200 359.99 UKP (base configuration)

Falcon is about two thirds as much again as an A1200. What upgrades can you get for 230 UKP for the A1200? I am asking out of curiosity - I don't mean anything by these figures, I'd just like to know what configuration of A1200 you can get for the same price as a Falcon in this country.

Cheers
- Andy. < The Man From U.M.I.S.T. >

Does this mean you'll re-write a meg of C code in DSP assembler? I'd
buy a Falcon tomorrow if you'll port POV-Ray 2.0 to the Falcon's DSP.
Oh, and it's gotta run in the background, since I'll have MiNT going all
the time (need those nice minix partitions).

I guess you're saying that portable code is a bad thing, since it
doesn't use the specific features of the machine (in this case, the
Falcon's DSP to improve its otherwise poor raytracing performance). Or
maybe you're saying that CPUs are a bad idea, and we should have
co-processors doing everything; I'd rather have a bit more brute force
that a useless co-processor, no matter how elegant.

> Talking of improving code, have you noticed how the features offered by
> the pentium will not be used because lazy software houses are using the extra

Doesn't really matter; Intel will be building very few Pentiums this
year, since it's selling too many '486s. They don't want to lose any of
that scary momentum.

> >Software will never be available for the Falcon.
>
>

> Never is a long time.

Isn't it though.

> days of 8 bit computers.

So many of those have the easy-of-use of WYSIWYG; those are fine if your
output is going to a 9-pin dot-matrix printer. The trusty DJ-500 beside
my ST would be quite annoyed if I treated it like a tty all the time...

>
> It os a bit long, but I'm not trying to undo the brainwashing you suffer
> from.

Actually, Atari did that when the much-touted Falcon had a 16-bit bus,
despite Atari telling us that it was all 32-bits. You've been
brainwashed to think that anything PC (and I imagine that includes Macs
as well) is junk. Pity you've never used anything better than an Atari;
any PC with OS/2 on it is nicer to use.

> >Obviously, you can say, "My computer does all I want it to!" and I'll

> deserve PC kludgeland.

Time is money (in my case, up to $35 Cdn/hour). Luckily, the ST has a
single-tasking OS, and not enough RAM. When my 4M machine is compiling
code, I can't do a damn thing, since GNU C uses all of the memory.
Those 12-hour builds of NetHack can get a little tiresome the third time
around...

I guess that's just another aspect of PC wastage, right? C compilers
shouldn't be so huge? Well, it's a unix application; does that mean FSF
doesn't know a damn thing about optimisation? I doubt it, GNU C
produces the best code.

> Gavan.

Once you multitasking OS can match my clutch of Sun Workstations then you can talk.

BTW, you assume a lot about my background in your posting. I was talking as UNIX usr/programmer not as an Atari fan. But then the idea that I might have experience and background to match my assertion seems beyond you.

Proper memory protection is a *must*. All else is chance and a prayer.

# 1610. Re: A1200 15 pc Faster than Falcon? (RE: Photo CD)

> Fair enough. So wheres the photo-CD add-on drive for the Falcon.
> I dont see Falcon photo-CD players, do you?

The Falcon doesn't need a dedicated photo-CD player from Atari. Any SCSI CD-ROM drive that is also photo-CD compatible will work. All you need is the software. The software DOES exist (not sure from whom, but it has been shown, used and sold at Atari shows).

> Maybe Atari licensed it for the Jaguar CDROM ? It would make

I'm sure that was part of it. The Jaguar is advertised as being able to play data CDs, Karoake CDs, CD+Gs, everything including the kitchen sink CDs, and, of course, the Photo-CD.

> So far, the world isnt crying out for photo-CD, so its not

Yes. Last thing I read about the photo-CD was that Kodak was losing money big time on it. That's probably why Kodak is so anxious to license it to companies like Atari, and then write the development software FOR them.

->->->((JP))<-<-<-

I predict that exact reproduction through cloning will not become popular. Too many people already find it difficult to live with themselves.

>deftly) is _so_ convenient and easy to use...

I`m not saying 16 bit is crap, just that for the sorts of things
that most people use high colour displays for, the pseudo 18 bit of
HAM8 is better. HAM8 is also better for animation. Obviously, as a
graphics artist, you will want individual addressability of pixels
which is something HAM8 isnt terribly good at. Surely, you would be
looking at true 24-bit though if you are thinking of doing some
serious gfx work?

> A 1 meg Falcon is as much use as a chocolate fireguard, as is a 2 meg

I use a 2 meg A1200 at the moment and its pretty useful, although
obviously I`d like more memory. I`m hoping to get 4 megs fastram
soon but I`ll see what the situation is with the CD32 add-on first.
I agree that 4 megs is the minimum acceptable config for serious
work these days.
Getting standard games to work in 2 megs is no problem, as most
Amiga games use only around 1meg at the moment.

> Probably correct, but for a C compiler or a spreadsheet you will
>certainly _need_ that 50 MHz 030 you mentioned to outperform the 030

>access to memory. (I must remember to look up instruction timings for
>the 030 and 020 to check where differences lie...)

I only need a true 32-bit 68030 at 16 Mhz to outperform the Falcon
68030. I know that the 030 was optimised over the 020 but how much
remains to be seen. I think the big leap in Motorola CPUs was
68000->68020 just like the Intel leap was 286->386

> (Don't annoy all demo coders out there by saying that when it comes to
>writing 'real' code they're all useless, will you... :-))

demo coding requires more skill than `real` coding for sure. The
problem with demo coders is sometimes they cant write proper system
friendly code - especially important with a multitasking OS.

> Current UK prices (from the September 1993 copy of ST Review)

> Falcon 1M no HD 589.99 UKP (only 1 stockist for this configuration - all
others had a 4 M Falcon as the base machine.)
> Falcon 4M 65M HD 899.99 UKP
> Amiga A1200 359.99 UKP (base configuration)

wrong, Unless C= have bumped up the price of the A1200 the official
MRP is 300 UKP. I`ve seen it mail-order for 270 UKP.

For the 300+ pounds difference you can buy a 4 meg fastram
expansion and an 80 meg IDE HD. That gives it a big edge over the
F030 at base.
For the 600+ pounds difference to the 4/65 you could get a 50MHZ
030 with 4 meg ram and an 85 meg HD. This is much faster than the
F030. Even the fastram 020 is arguably 15% faster (?)

>mean anything by these figures, I'd just like to know what configuration of
>A1200 you can get for the same price as a Falcon in this country.

Look at the orignal post for the config of an A1200 against the
F030 base, itemised.

Nope, I don't know, but I know a person on IRC who has code
doing the Akiko work faster than Akiko in software. Here:

<_ho_> Pjotr: on A1200+fast... same speed as CD32 [no fast]... [ie about a
factor of 2x out]

...using 4000/040 there's no need for the chip.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Rather dependent on the type of animation you are talking about, one
suspects. 'Animation' covers a lot of ground - if you want some animated
figure moving over a static background then I suspect the Falcon's 16
bit mode is better. If you are talking MPEG type animation, then you
might be right but I would like to see what difficulties are involved
in displaying an MPEG compressed animation on a screen using a HAM8 type
display to be sure that no artifacts are introduced by HAM 8's particular
peculiarities.
I hope you realise that saying HAM 8 is better for animation is probably
addressing the problem in rather too broad terms.

>graphics artist, you will want individual addressability of pixels
>which is something HAM8 isnt terribly good at. Surely, you would be
>looking at true 24-bit though if you are thinking of doing some

I would, of course, like a true 24 bit display. At the moment though
I am quite content with using the 16 bit display on the Falcon. I don't
intend to restrict myself to 16 bit forever of course. When I decide what
I require I will upgrade. (At the moment I am lusting after an Epson GT6500
A4 colour scanner - a snip at 900 UKP !! :-)) _And_ it comes with Falcon
software...
The Falcon also has the DSP of course, which I am eager to program on
- I would certainly say that its presence swayed my decision considerably.
(DSP programming can be a useful skill)

Yes, but will this last if games regularly start to use 256 colour
modes? Graphics storage requirements can become quite big quite rapidly.
Time will tell...

> I only need a true 32-bit 68030 at 16 Mhz to outperform the Falcon
> 68030. I know that the 030 was optimised over the 020 but how much
> remains to be seen. I think the big leap in Motorola CPUs was
> 68000->68020 just like the Intel leap was 286->386

I'm not so sure. The 68020 is by no means a quantum leap over the
68000 in terms of speed. The 32 bit access helps, but most of the
instruction timings (excluding the memory access parts) are broadly
comparable. The integer maths is improved as I recall, but most other
improvements are fairly marginal. Any instructions operating on
Longs naturally benefit in the 68020.
I don't know how much of a gap exists between the 68020 internals and
the 68030 internals (after taking into account the extra data cache). It
is possible that they might offset the A1200's better memory access, but
I make no definitive statement on this subject until we have some hard
facts.

Anyone?

> demo coding requires more skill than `real` coding for sure. The
>problem with demo coders is sometimes they cant write proper system
>friendly code - especially important with a multitasking OS.

The demo coders that I know have all adapted quite well to writing
system code. Although the instinct is to hack, they seem to overcome
it admirably...
:-)

>> Falcon 1M no HD 589.99 UKP (only 1 stockist for this configuration - all

The prices I gave are all non mail-order, off the shelf distributor prices.
If I looked around I could probably find the Falcon cheaper via mail order,
but I picked up these prices on a look through the magazine, so they _are_
correct at time of printing.

It is, of course, possible that C= may have had to up the A1200 price...

> For the 300+ pounds difference you can buy a 4 meg fastram
>expansion and an 80 meg IDE HD. That gives it a big edge over the

Assuming that your current figures are correct then this could well be
the case. As I said, I doubt if the difference would be that big if I
bothered to hunt for the cheapest Falcon price around...

By animation I usually mean animation of the `new screen frame
every xth of second` kind. This is the most useful kind of
animation. Certainly the sort that MPEG would use. Of course, if you
are plotting objects in a cel-type manner than the 16 bit mode would
be at an advantage. This cel type animation has been used in the
past on computers as it was easier to do than full-screen. With the
advent of more memory, HDs and fast processors I would say that
almost all real-time animation these days would be page frame. Of
course, true professional quality is single frame to a laserdisk or
film. I think HAM8 would have the edge here too as it offers a wider
range of colours than 16-bit. Also, the way HAM8 works actually acts
as a form of anti-aliasing(!) Its true, I`m suprised C= didnt try to
bullshit `Built in anti aliasing` as a `feature`.

ahh, but the Amiga actually can offer many 24-bit solutions *right
now*. (provided you have a Zorro Slot machine). I dont think theres
many 24-bit boards for the F030.
The GT6500 is excellent. I`ve a friend who knows someone with one
and the scans are superb.

> The Falcon also has the DSP of course, which I am eager to program on
>- I would certainly say that its presence swayed my decision considerably.

I`m not so sure that there is such a big market for people who
can program the 56001 (?) DSP. Its nice to be able to say you can
though. Hey! Just tell them you can at job interviews, they`ll never
know!

Source record: 21649
Cross-posted to: comp.sys.amiga.advocacy,comp.sys.atari.advocacy

Hey! MAC owners listen up too.....

As far as I can see, the future business market IS ibm PC compatible. Lets face it, they have around 90% + of the market right now and I`d say we`re heading for 99% in the next five years. Of course, as a *home* computer user I dont really give a F*ck about how the business market is going but I do care that we have a thriving market for home computers, not one that gets choked by ibm weeds.

It seems to me that the Amiga, Atari and Mac lines are the perfect machines for the home market. They all have 68k type processors which give better performance than the equivelent intels, and all have GUIs now as standard. The Amiga and Atari at any rate also have lots of cheap software suitable for home use.

In order for the `home computer` market to succeed, it needs to have a viable range of machines. If C=, Atari and Apple concentrate on smashing each other, they are killing their own market in the long run. Theres no reason why Amiga, ST/Falcon and Mac lines cant all coexist catering for slightly different tastes. The Amiga and Atari offer facilities that no PC compatible can and the home market will be a lot worse without them. Apple are on slightly dodgier ground as they dont have a lot in the way of cool features, except for the GUI which they are now licensing. Assuming any PC owner would want the Apple GUI, they are in big shit as the PC hardware manufacturers undercut them in a big way. Apple dont really sell a computer, just an operating system and a (incredibly false) trendy image of `freedom`.

In order for the market to really flourish, there would need to be some degree of compatibility between the computers. Of course, being 68k machines with quite similar gfx capabilities it is easy to xvert software, but I would suggest that what we need is an OS that we can run on all 3 machines IN ADDITION to the native OS on each machine. LINUX is a possibility as it provides a UNIX-like environment with good cross platform compatibility but it suffers from (on the Amiga version at least) only running on 68030 (MMU) and 68020+68851 machines which are hardly common. Would it be possible to Xvert LINUX to run on any machine?
Another option which looks promising is MiNT. From what I have heard of this system it promises many of the features of UNIX whilst not needing an MMU (using one if installed tho`) and running concurrently (the ST version at least) with the native OS. I hear

its been ported for the MAC too. If we had a system, maybe MiNT, on all 3 68k platforms running concurrently with the OS we would have an excellent environment in which to develop business and personal productivity software for non-pc compatibles. It would create a large viable market for non-pc business/financial software. Something like MiNT or LINUX would allow easy porting of said software to UNIX systems too......

Does anyone care to comment. Please no `ha! you`ve thrown in the towel posts` from mac bullshitters - face facts boys, you know you`re not going to beat the PC in the corporate market.....

>got `lost` in the post.

In the late 1970's, it would have been nice. But this is the nineties,
and programmers today expect to have a little more than three registers,
of which only one is a general-purpose register. The 65816 is a nightmare
to program, especially if you're used to a well-designed processor like
the 68000. I did some work for the C64, but unless I got a LOT of money
for it, I would never, ever touch a 6502 derivative again.

> It`s certainly misleading though, of nintendo to call it 16-bit!

I'm kinda surprised that they don't push it as a RISC processor,
considering the abysmal instruction set ;-)

>Also, for a games console it is very limiting -

>around at the same time and the CPU has to track them all!!!!!

Yep. When you have to do collision-detection between 20-30 objects
and the background, things start to get hairy on the SNES :(

Since when did the A1200 got a Zorro Slot? I got the distinct impression
that the discussion was A1200 vs F030 (or somthing like that) ;-)

## 1620. Spanish dictionary

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-08 20:16:44 UTC
From: deras@andromeda.rutgers.edu
Message-ID: <Sep.8.16.16.44.1993.19104@andromeda.rutgers.edu>
Source record: 21651

Does anyone know whether there exists a Spanish dictionary coded in ASCII,
which I may get through FTP? I am in urgent need of such a dictionary.

Please let me know at deras@andromeda.rutgers.edu in case you have any
information, even related one.

Thanks in advance,

angel deras

P.S. I am cross-posting this message to reach as many people as possible.
I extend my apologies.

>range of colours than 16-bit.

Some MPEGs can do a 'cut' from one scene to another quite rapidly (ie
in the space of a frame.) If you were working in the A1200s HAM8 mode
would you not then have to process the _entire_ image to arrive at a
new optimal 64 base colours? And wouldn't each pixel take more time to
calculate than in the Falcon's 16 bit mode? You would have to work
out which base colour you could modify to obtain the nearest possible
value, and you would have to do this every frame, for every pixel or
it would look a bit ropey. Given a 16 bit mode, each pixel is a
relatively simple quantisation of a 24 bit colour value to a 16 bit
colour value. I'm not convinced of HAM8's advantages for MPEG type
compressed video - I think you might require considerable additional
processing on top of the normal MPEG decompaction in order to obtain
a reasonable result, I would very much like to see how well a normal
A1200 deals with it. Or am I completely wrong about this - does the
A1200 have some form of special processor that could automatically
reoptimise the 64 base registers for a changed image?

>Also, the way HAM8 works actually acts
>as a form of anti-aliasing(!) Its true, I`m suprised C= didnt try to
>bullshit `Built in anti aliasing` as a `feature`.

I think that the Anti-aliasing effect you describe will be a similar effect
to the effect gained by application of a smoothing filter to the image.
This will result in a slightly blurred version of the original image, which
may or may not be desirable.
From what I know about HAM8 (correct me if I'm wrong), the effect will
be a bit unpredictable from image to image, depending on image content and
what your base registers values are set to. I would doubt if this effect
will be very useful in the majority of cases, It will certainly affect
image fidelity.
Of course, quantising an image into HAM8 or the Falcon's 16 bit mode will

affect image fidelity anyway :-).

> ahh, but the Amiga actually can offer many 24-bit solutions *right

> The GT6500 is excellent. I`ve a friend who knows someone with one
>and the scans are superb.

I believe there is an upgrade of one of the ST 'Crazy Dots' 24 bit
colour boards available for the Falcon, but I would have to check. I
understand that the A1200 is not without compatibility problems :-),
do all the Amiga 24 bit solutions work for it with no hassle?
I shall, of course, rush out and buy the GT6500 tomorrow (and the devil
will be skating to work :-))
Ahh, well. The problem here is definitely a lack of infinite funds,
if I had such funds I probably would not be working with Amigas or Falcons.:-)

> I`m not so sure that there is such a big market for people who
>can program the 56001 (?) DSP. Its nice to be able to say you can
>though. Hey! Just tell them you can at job interviews, they`ll never
>know!

Don't count on 56001 DSP not being a useful skill. It is more the
DSP _theory_ rather than anything else that it is useful to have a
grounding in. Such theory is best obtained through some study, and
then attempting to put it into practice, and the Falcon provides a
good base for this sort of thing.

Cheers

GEM-View (shareware) can read PCD files (up to 'base').

>though, which rotates ALMOST the whole screen at 50fps ...

Hmmm... But by looking at Plasma50 I got the impression that they are
simply doing the processing for about one third of the total screen area,
and then dynamically changing the screen address twice down the screen.
Result is that it looks like the whole screen is being manipulated, but
actually only about one third of the screen is involved...

Or am I wrong?

I think this is also a technique used in ST demos such as Dark Side of the
Spoon to do full screen parallax scrolling in Overscan, because I did some
calculation, and they are exceeding the processor bandwidth of the 68000
if they aren't cheating somehow!

>Anyway, Termfin has to be seen to be believed ... and there are better ones on
>the way .. :-)

From you? Or just someone you know?

Have you noticed any real Falcon demo incompatibility problems?
I can't get CEBIT 93 to work because it seems to think I'm using a VGA
monitor for some reason. My Monitor cable is an old one I reworked from
my ST days, and does not carry the M0 or M1 signals, so this could be
screwing it up, but if it is detecting an RGB monitor like this, then it
also would screw up on a TV... That's a bit sloppy...

>Hehe .. <blush> .. yes ... I'm a member of Sync .. the greatest group of
>programmers/graphicians on the ol' ST .... too bad we never actually released
^^^^^^^^^^^
Not quite - you didn't have me on your team... <grin> :-)

Besides some other groups might have something to say about that... :-)

>our big stuff .. ;) ... "Redhead" (Bengt) has done a few (10-11) inhouse
>programs like a disassembler and such that beats everything on the market, that
>too hasn't been released .. :-)

Tell me the old story - Myself and a friend are about to get around to
releasing our first ST/Falcon game (shareware). It has taken us a year to
produce, but we have been working on stuff for over 3 years - just never
got around to releasing any of it! This game is _definitely_ going to
be released 'Real soon now', and has some Falcon enhanced features so

watch this space. I'll fill you in in email if you're interested in knowing more about the game...

>I think the only thing he (and Tore) got out was "Audio Sculpture" on the ST/STE

I've played FZero. It was fun to watch at first, but once novelty value
wears off, it is painfully apparent that there is no real game in there.
I played it for fifteen minutes before I got bored to death with it and
asked for a different game. Realtime rotated sprites alone doesn't make
up for lousy gameplay.

>That's why I have a SNES.

For novelty value? Almost all SNES games I've seen have been of pretty
low quality. There are a few exceptions, though - like SFII, and some of
the Disney games.

>The 65816 hasn't got much to do, it's enough.

Once you try to get more than a couple of objects moving with collision
detection, motion "intelligence" and so on, it becomes obvious that the
CPU is underpowered.

Wouldn't you rather see a 68020 at 14MHz in there? If there had been
one, there would be a lot more variation in the games available for the
SNES. It would save the game programmers a lot of grief, too.

: >the Jag, just like the LeMans winning Mazdas, except it powers the
: >air-conditioner and we have a 4 cylinder engine to power the car...
:
: Ah, finally a topic of interest. You know, I think the RX7 is nice and
: all, but it is just too small for my taste. It gets excellent performance
: with only 255 hp, but that's to be expected in such a small size. Similarly,
: a Porsche 911 Turbo will beat just about any other street car, but it is so
: much smaller than, say, a Viper. I'm not saying I wouldn't want the Porsche,
: but I'd take something like the 320 hp, 94 Stealth R/T Turbo over the Rx7.

I'm suprised that Mazda don't make the quad-rotor engines more widely
available. They're not much bigger than the Turbo rotaries that they
use now and can be retro-fitted to the older 13b Rx7's (though, not
exactly 100% street legal over here in Australia, having <> 400 hp
engine in a street car).

The car that I would love to have is the Nissan GTR. I don't know if
it was ever sold anywhere outside of Japan in numbers (only 100 were
offered in Australia). They had a 3litre twin turbo engine, producing
220kW of power, used in production car racing. 4wd gave them great
grip and they just blasted everything else off the track, turbo
restrictions on max rpm, extra weight penalties, etc didn't stop them.
Once in a while a BMW M3 would beat it on a tight and twisty track, but,
those Nissans were sure fast!

A$110,000 was a reasoanable price to pay for something that was essentially
the same thing as the race cars. The other production cars were heavily
modified, bearing very little resemblance to the cars you see in the
showroom. Over here, you'll be lucky to get any new model Porsche, like
the 968 or above for <A$130,000.

Oh, and the Nissan GTR was rated a better car than the 911 Carrera 4 and
the Turbo by a lot of production car racers, Alan Jones (ex F1 champ)
and motoring press when given a chance to have a shoot out between
the "super-cars". Super-cars over here isn't quite the same as supercars
over in the US, as hardly any Australians can afford a McLaren, XJ11
or any other exotic, one-off F1 spin-offs. The cars were tested on
a race track and the people's feelings were noted and compared.

In fact, the car that you bought from the showroom could go faster than
the cars that were raced, as they didn't have any handicaps placed on

them. Though, I think having an exhaust pipe for road use is going to
slow your car down.

BTW, what is a Stealth for those outside of the US? Is it 4 door or
2 door coupe? What does it look like? 4wd? Non-ferrous body panels?
Carbon running gear?

## 1631. Yet another Tramiel wrong guess...

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-09 19:01:23 UTC
From: bjgrier@bnr.ca
Message-ID: <1993Sep9.190123.29058@nrtpa038.bnr.ca>
Source record: 21665

Just in on the company news feed:

>2. IBM UNVEILS NOTEBOOK COMPUTERS WITH MULTIMEDIA, PEN CAPABILITY
>
>International Business Machines Corp. has introduced four new
>notebook computers, the first such products in the growing notebook
>segment to offer multimedia, wireless communications and pen-
>based computing capabilities, Reuters News Agency reports. The
>ThinkPad 750 Series notebooks - lightweight, portable computers -
>offer wireless communication ability, speech recognition and on-
>screen television, in addition to powerful computing functions. The
>line includes a 16-bit stereo audio subsystem and a high fidelity
>speaker. It also supports microphones, headphones or portable stereo
>speakers.
>Toronto Star Thu 9 Sep 1993 Infomart
>MIN 93164

So far in the last thirty days Apple, and now IBM have entered the PEN computing arena. And just where is Atari's version? (Atari was the second company to DEMONSTRATE a Pen computer) Dead because "there would never be enough of a market." I wonder if Apple and IBM wait for Tramiel to pronounce something as unprofitable, or not enough market, to make sure it really is a good idea?

<sigh>

What do you call 32bit col then?

I still am quite sure of the definition of True Colour, I guess I will have to find a reliable source though before I stab you in the back ..

SB> What do you do with your computer, then? Work?

Exactly. Typing/Programming/Exploring/Learning ... anything EXCEPT playing games which is what GAMES CONSOLES was designed for ..

I will ofcoz import an Atari Jaguar this christmas ..

SB> What if you want to both have fun, and make money? Choose the A1200 and
SB> make games instead of silly demos.

Tssssssss .... If I *WANT* to make a game I would do it on a computer I know .. that's a Falcon ... (maybe converting FZero from the SNES .. or make a lookalike ... something that's possible on the Falcon but NOT on the A1200 .. )

SB> How about the articles in the latest issue, concerning the A1200 demand
SB> (people want more A1200's than C= can produce), or the fact that Commodore
SB> Sweden made more money than ever during the last few months (mainly due
SB> to the AA Amigas) ??

The same issue then as they declared Commodore dead in? Sounds weird.

I know one A1200 owner, he's NOT pleased with his machine. That's all I need for promoting the Falcon .. :-)

> Gavan

A side note here... I have a Falcon Photo-CD display program already, although I don't know how well it works yet as I haven't bought a CD-ROM. The software seemed rather nice at the Atari show I bought it at though. It's called "Photo-show", cost me $40, and I can upgrade to the "pro" level (whatever that means!!) for $10. I believe the software loads in all of the different bases (sizes of picture) from the CD... I am unsure about any exporting capability.

As a side note, this is one of the reasons I really appreciate the SCSI-2 interface built in on the Falcon... although I'll probably only buy a normal SCSI CD-ROM (the cheapest I've seen a multisession double-speed one for is something like $250). Also, I need to add either a floptical or syquest removable drive, another use for my beloved SCSI-II interface...

They didn't say `never'. They said `now'. And if you look at the market for
these machines (< 10000 last year), they were absolutely right. One of their
better decisions.

sinclap2954@cobra.uni.edu writes...

>> CRAP. The PC is the standard. Its already hit Atari and Commodore
>> hard and Apple _will_ be the next victim.

>Mean while Mac sales have increased..

If they have, its due to apples total pricecutting policy. Apple
_profitability_ has plummeted. Anyone can sell more computers by
slashing the price.

>> Q. Why Do people buy macs?
>>
>Productivity, dependable company....

and of course it is impossible to achieve productivity on any
other platform....

>I suppose C= is not competeing with the big boys. C='s sales have declined in
>Europe buddy.

The Amiga doesnt directly compete with the PC. Apples main DTP
market IS competing with DTP on the PCs

I suppose the fact (?) thats C=s sales declined in Europe and Apples
sales rose is a really good reason to buy a Mac then? Get real
asshole, dont spend your life following the crowd.

>The Falcon lost their nich market. Atari posted sales of 6 million in the last
>quarter and lost six million too.

again the obsession with sales figures. You must be really
insecure. Its fair to say that the increased sales will translate
into better business software support but as my post concerned the
home market, this is irrelevent. For _home_ use, the Amiga is a
better bet than the Mac since the Macs increased business sales
count for nothing here. If all the Macs were bought for home use
then you would have a valid point. They werent, they were mainly
bought for the business market.

>> The Amiga and Falcon *dont* compete directly against the PC (not
>> anymore). The mac *does*. All of its market niches can be bettered
>> by the PC.
>>
>You want to make a bet?

What can the Mac do that the PC cant????

>And the increasing number of Macs. You obviously don't know what you are
>talking about. I suggest you start reading the Wall St Journal and maybe Value
>line. You are a cluless Amiga droid.

Is the number of macs increasing in line with the number of PCs? The
business computing market is exapanding, so its only natural that
the players in the market will ALL be selling more systems. (I mean
that more PCs will be sold, not that all the individual PC companies
will sell more). The players are: Apple with the Mac and Dozens of
companies selling the PC.

>> Oh, and the new CD32 offers an *excellent* multimedia platform.
>> All that power in a box costing 300UKP/ 400$. I doubt you`ll find
>> any mac (or PC for that matter) system which offers so much for so
>> little cash.

>CD32 is crap. At least PC and Mac users can attach a dual speed one to their
>machines.

Oh yeah? How are you going to display all the Multimedia stuff you
create with your overpriced Mac systems??? Are you gonna put an AV
mac in every shopping mall that you want to put your system in??
Create on the Amiga and you have an excellent MM player in the form
of the CD32 to replay your creations on. You seem to forget that to
be of use, you need to actually get machines into real life to run
your presentations on. At $400 a CD32 is a much better bet for
widescale distribution than a $5000 AV Mac.

>> So lets not have any more of your whining `buy the Mac` posts.
>> Ive had enough of hearing how we should all buy mac computers because
>> they are the `standard`. See what the `standard` is in a couple of
>> years time (PC) and then tell me spending thousands on a Mac is a
>> sensible, economically justifiable idea when I could spend less on
>> an Amiga or about the same on a PC.
>>
>Spending thousands on a Mac and PC? I don't think so. I suggest that you read
>the paper, espicialy the front page not the sports section. Macs and PC's are
>cheaper than Amigas in the U.S.

You are the mindless droid Mr Sinclair-Day, as I pointed out
that the PC was better value than the MAC. I Wasnt blindly
advocating the Amiga in the same blinkered way that you push the Mac.

The Mac is competing in the business market against the PC. One
company makes the Mac, hundreds make the PC. PC prices are more
competitive than the Mac and will be even more so in the future.
Apple simply cannot hope to compete on price or specification with
the PC.
*The mac will be EATEN ALIVE by the PC in the business market*

I buy my computers to use at home and I WONT join the mindless
set of people buying a PC because `everyone else has got one`.

## 1638. F30-A1200 benchmarks!

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-10 10:39:48 UTC
From: zcam1121@rpool9.rus.uni-stuttgart.de
Message-ID: <26plhk$uod@info2.rus.uni-stuttgart.de>
Source record: 21672

Ok guys, here are the first benchmarks which i have made with my Falcon 030
and an A1200:

Notes:
The A1200 has NO FastRAM (if there is an Amiga-User with FastRAM: please
type in the benchmarks und post the time the A1200 needs!). Sorry, but i
can't get one with FastRAM.
There is no use of the DSP build in the Falcon. With special DSP-code you
can get more then 10times faster programs.

```
--------------------------------BENCH1---------------------------------
bench1:
move.l #$40,d6
loop0:
move.l #$ffffff,d7
loop1:
move.l buffer,d0
add.l #10,d0
divu #10,d0
move.l d0,buffer
muls #20,d0
dbra d7,loop1
dbra d6,loop0
rts
buffer:
blk.l 10
```

This is a loop repeated 1073741760 times. There are moves, some arithmetics
and at least some branches.
F30 (640x200x4 60 Hz): 21.3 s
A1200 (640x200x4 60 Hz): 31.1 s
dito with forbid(): 30.5 s
(forbid() stops all other tasks -> no multitasking).
F30 (640x240x256 60 Hz): 24.5 s
A1200 (640x240x256 60 Hz): 40.1 s
dito with forbid(): 39.0 s
F30 with both caches off: 43.1 s

Now the same benchmark with words instead of longwords:
F30 (640x240x256 60 Hz): 21.5 s
A1200 (640x240x256 60 Hz): 32.7 s (with forbid())

Results:
Loss caused by higher resolution: F30 -13%
A1200 -22%
Loss caused by Longs instead Words: F30 -12%

```
A1200 -16%
Overall: The F30 is about 34% faster than the A1200 in this benchmark.

------------------------------BENCH2-------------------------------------
bench2:
move.l $40,d6
loop0:
move.l $ffffff,d7
loop1:
movem.l buffer,a1-a6/d0-d5
movem.l a1-a6/d0-d5,buffer
dbra d7,loop1
dbra d6,loop0
rts
buffer:
blk.l 20

This is a test of memory-movement.

F30 (640x240x256 60 Hz): 48.6 s
A1200 (640x240x256 60 Hz): 126.1 s
dito with forbid(): 124.2 s

Now with words instead of longwords:
F30 (640x240x256 60 Hz): 34.3 s
A1200 (640x240x256 60 Hz): 68.8 s

Results:
Loss caused by longwords instead of words: F30 -30%
A1200 -45%
Overall: The Falcon is 55% faster than the A1200 in this benchmark.

------------------------------BENCH3-------------------------------------
bench3:
move.l #$40,d6
loop0:
move.l #$ffffff,d7
loop1:
move.l buffer,d2
add.l #10,d2
divu #10,d2
move.w buffer,d3
or.w d2,d3
cmp.w d2,d3
move.w d2,buffer
move.l d3,d1
muls #20,d2
movem.l d1-d3,buffer
lsl.w #3,d2
sub.l d2,d3
cmp.w d2,d1
bchg #0,d2
```

```
move.l d2,buffer
dbra d7,loop1
dbra d6,loop0
rts
buffer:
blk.l 10
```

This is an enhanced version of bench1 (with logical arithmetics, shifts, bit-operations, comparisons etc.).

F30 (640x200x4 60 Hz): 38.8 s
A1200 (640x200x4 60 Hz): 48,4 s (with forbid())
F30 (640x240x256 60 Hz): 42.5 s
A1200 (640x240x256 60 Hz): 54.5 s

Results:
Loss caused by higher resolution: F30 -9%
A1200 -11%
Overall: The F30 is 22% faster than the A1200 (relativly to A1200).

Ok folks, that's all. No comments on this! I'm waiting for the figures of an Amiga 1200 with FastRAM...
All figures can be easily checked by yourself!

Ciao, Heiko
(zcam1121@rpool9.rus.uni-stuttgart.de)

A> actually only about one third of the screen is involved...
A>
A> Or am I wrong?

Well, yes .... First, the screen is in full overscan, second, the piece they are processing is in itself as large as the two "copies" .. I would say that they're rotating half the screen .... not 1 third ..

A> I think this is also a technique used in ST demos such as Dark Side of
A> the
A> Spoon to do full screen parallax scrolling in Overscan, because I did some
A> calculation, and they are exceeding the processor bandwidth of the 68000
A> if they aren't cheating somehow!

That's called the "ST-Hardware scrolling" .. (or Sync-scrolling!) .. Invented by us, allowed FULLSCREEN SCROLLING in 7-8 scanlines of processortime .... VERY complicated to explain though .. :-)

A> From you? Or just someone you know?

Ah! .. :-) ... Seen the Speeder demo? SNES Mode 7 emulator? ... That will be used quite soon .. ;)

A> Have you noticed any real Falcon demo incompatibility problems?

Nope, as long as you gave access to both a TV and a VGA .. :-)

A> I can't get CEBIT 93 to work because it seems to think I'm using a VGA
A> monitor for some reason. My Monitor cable is an old one I reworked from
A> my ST days, and does not carry the M0 or M1 signals, so this could be
A> screwing it up, but if it is detecting an RGB monitor like this, then it
A> also would screw up on a TV... That's a bit sloppy...

Hmm ... dunno .... I do know that a friend of mine made a program in which you just set "Monitor type you use", and then "Monitor type you want all programs to think you're using" .. :-) .. works very well ...

A> Not quite - you didn't have me on your team... <grin> :-)

Ah, but we had BlueSTar .. ;) ...

A> Besides some other groups might have something to say about that... :-)

Nah .. the big ones were Sync, Omega and TCB at that time ... and those "Union" guys .. :-)

A> Tell me the old story - Myself and a friend are about to get around to
A> releasing our first ST/Falcon game (shareware). It has taken us a year to
A> produce, but we have been working on stuff for over 3 years - just never

Well, then optimize your code .. :-) .. (Most amiga programmers never do .. I
have to help a friend of mine with that every time he has written something ..
:-)

SB> Wouldn't you rather see a 68020 at 14MHz in there? If there had been

68EC020 .... nope ... lousy processor ..

SB> one, there would be a lot more variation in the games available for the
SB> SNES. It would save the game programmers a lot of grief, too.

Don't think so, looking at the games one can clearly see that the processor is
doing it's job, and quite well too ..

Anyway, what makes the SNES superiour is the custom graphics chips ... of which
the CD32 has NONE ..

No. Most Amiga programmers DO optimize code. Most PC programmers... But
let's not talk about that, instead let's talk about the usefulness of,
for instance, not having to code your own divide routine.

Oh, I SEE... So the 65816 is a GREAT, FABULOUS, DIVINE processor, despite
having a slaughtered instruction set (nope folks, it ain't RISC... Not enough
general-purpose registers - one? ONE?), while the 32-bit 68020 sucks like
shit? Um... I sincerely hope you're not in any kind of electronics or
computing course. Although it would explain a lot about the Gripen...

Yeah, you really need a lot of processor power for F-Zero *rofl*

Your processor bench marks look reasonable but you did not mention the cache
mode on anything other than the Falcon in the first test. Could you continue your
testing and get numbers for all tests with and without the instrucion caches
enabled and disabled on both machines.

Over all your numbers are coming in line with my previous predictions
about the memory access speeds of a no mod A1200 and a no mod Falcon,
the Falcon would show approximately 40% faster memory access, due to the
extra 3 wait states that A1200 requires to access it's standard RAM.
The fact that the overall system performance difference is not 40% shows
that the video contention is about what most people feared (I sure wish they
had used video-rams and basically removed video contention from the system,
but most Amiga Users will have the same complaint)

Thank you for this informative post and I'll look forward to the rest of
your results. Maybe someone else can create a set of tests that would cover
hard disk copies, and that type of thing.

Brian

>SB> modes.

>What do you call 32bit col then?

If you had read what I wrote a bit more carefully, you would see that
it is called "True Colour".

>I still am quite sure of the definition of True Colour, I guess I will have to
>find a reliable source though before I stab you in the back ..

Do that. You'll find that you're the one who's wrong. If you can't take
that, you'll have to educate the rest of the world about the new definition
of True Colour ;^B

>SB> What do you do with your computer, then? Work?

>Exactly. Typing/Programming/Exploring/Learning ... anything EXCEPT playing
>games which is what GAMES CONSOLES was designed for ..

That's not "work" - that's playing around. Nothing wrong with that, but
it doesn't generate any money. Nothing wrong with that, either, but money
is nice for buying stuff.

While we're at it: Are there any games for the Falcon?? I'm curious.

>I will ofcoz import an Atari Jaguar this christmas ..

Well, I wish you good luck with it then. Chances are it will be a massive
disaster for Atari, but it might be successful - who knows? If it's a
success we will probably develop stuff for it, too. I don't have anything
against Atari per se.

>SB> What if you want to both have fun, and make money? Choose the A1200 and
>SB> make games instead of silly demos.

>Tssssssss .... If I *WANT* to make a game I would do it on a computer I know
>.. that's a Falcon ...

I'm sure Falcon games sell over 30,000 copies. Especially considering less
than 20,000 units have been sold ;-) If you expect to have any financial
compensation for your work, making a Falcon game isn't quite the ideal choice.

If you had the choice of making $4000 on a Falcon game, and making $100000
on the same game on the Amiga, which would you choose? (Somehow, I know
you're going to say Falcon ;-)

>(maybe converting FZero from the SNES .. or make a
>lookalike ... something that's possible on the Falcon but NOT on the A1200
>.. )

Not that I have the time to prove it, but it's possible. You can of course
not rotate all the graphics in real-time, but that's not necessary when you
have 2MB of graphics RAM. Given the rather simplistic graphics in that game,
I'd say it wouldn't be too difficult to pre-calculate all ground textures
and then just blast them onto screen with the blitter. I have even seen
similar things done on the good old A500.

I find it hard to believe that you can do it in realtime on your Falcon,
either. The DSP is fast at some things, but unfortunately bitmap
scaling/warping isn't one of them.

>SB> How about the articles in the latest issue, concerning the A1200 demand
>SB> (people want more A1200's than C= can produce), or the fact that Commodore
>SB> Sweden made more money than ever during the last few months (mainly due
>SB> to the AA Amigas) ??

>The same issue then as they declared Commodore dead in? Sounds weird.

No. In the LATEST issue. BTW, they didn't exactly declare Commodore
dead, either, they simply said that they had had to lay off a number
of people - just like IBM and Apple.

>I know one A1200 owner, he's NOT pleased with his machine. That's all I need
>for promoting the Falcon .. :-)

Too bad for him. I know no A1200 owner who isn't pleased with his/her
machine. Maybe your friend just had too high expectations? That can
happen with any machine if you have unrealistic expectations. Or maybe
he just doesn't know what it's capable of?

Heiko,

I admit I think the benchmarks look solid, but there are some things
that should be probably be done to make it a bit fairer. For example,
I'd like to see more results of what happens when the loops exceed the
size of the 68030's data/instruction cache. Another thing I think should
be done (out of fairness) is to run the Falcon benchmarks under MultiTOS
if possible to get an idea of how much of a punishment we would take with
that.

Personally, though, I feel vindicated because this proves the Falcon isn't
the "dog" some people were saying it was. Although I'm hesitant to say it
is 50% faster than the Ami in terms of raw CPU power. :)

P.S., One last question.. what assemblers were used for the test?

Including Commodore who is currently dumping A600s with 40MB HDs (according
to some poster in comp.sys.amiga.advocacy) for $199. Hell, I may pick up
one myself. :)

So how does that differ from Commodore's strategy with the A1200? They are
selling it dirt cheap to achieve market penetration.

>>> Q. Why Do people buy macs?
>>>
>>Productivity, dependable company....
>
> and of course it is impossible to achieve productivity on any
>other platform....
>

Well, you can be productive in more ways, I think, on a widely accepted
platform. Let's face it, the variety of programs the Mac (and definitely
the PC) has for any given task exceeds that of the Amiga or Atari.

>>I suppose C= is not competeing with the big boys. C='s sales have declined in
>>Europe buddy.
>
>The Amiga doesnt directly compete with the PC. Apples main DTP
>market IS competing with DTP on the PCs
>

So are you saying the Amiga can't do DTP?

>I suppose the fact (?) thats C=s sales declined in Europe and Apples
>sales rose is a really good reason to buy a Mac then? Get real
>asshole, dont spend your life following the crowd.

>into better business software support but as my post concerned the
>home market, this is irrelevent. For _home_ use, the Amiga is a
^^^^^^^^^^^^^^^^

Let's clarify this point: WHAT IS HOME USE? What would a home user
demand of a computer that a typical PC user (not necessarily business user)
might be better served by an Amiga?

Is it games? Well, the PC has more games. Heck, go by a SNES for $89.
Is it desktop video? Well.. many people still don't have camcorders even!
Is it music? Why the Amiga? Why not a Falcon...?
Is it for programming? Well... anything could do for that if it appeals
to one's hacker instincts.

>better bet than the Mac since the Macs increased business sales
>count for nothing here. If all the Macs were bought for home use
>then you would have a valid point. They werent, they were mainly
>bought for the business market.
>

This just shows that Commodore (and Atari) both failed to get business
market penetration. So they have to sell consumer machines which can
beat the PCs in some aspect... perhaps video game consoles are where their
expertise will pay off. Who knows?

>Oh yeah? How are you going to display all the Multimedia stuff you

I suggested posting results of all test with and with out instruction caches
enabled, which he did for the Falcon on the first test. I like the testing under
Multi-TOS idea.

|>
|> Personally, though, I feel vindicated because this proves the Falcon isn't
|> the "dog" some people were saying it was. Although I'm hesitant to say it

|>

I never thought that the Falcon would be slow, just not fast enough to warrant replacing my TT :) It definitely is not 50% more CPU just more memory bandwidth than on an A1200 without FastRAM. The numbers comapring a A1200 with Fast-RAM are what I'm interested in, I've predicted that the A1200 will be able to access Fast-RAM slightly faster, 15%, than a Falcon can access standard ram.

|> P.S., One last question.. what assemblers were used for the test?
|>

Nice part about assembly language is that the assembler does not add another variable into the equation. I prefer the assembler that comes with Pure C, the GNU assembler uses a bastardised variation of the motorla syntax that is damned annoying, IMHO of course.

```

Actually that should be ($40 + 1) * ($ffff + 1) = 4259840 times. The dbra instruction only uses the bottom 16 bits.

```
>F30 (640x200x4 60 Hz): 21.3 s

>F30 (640x240x256 60 Hz): 24.5 s
```

Did you run this 640x240x256 test on a VGA monitor or was it really 640x200x256 on a TV? On a VGA the 240 line modes use line doubling, which means that you would get exactly the same results if you tried 640x480x256.
If it was tried on a VGA you should rerun it in 640x480x256 on both machines to get a fair comparison.

>Results:
>Loss caused by longwords instead of words: F30 -30%
> A1200 -45%

When you say "words instead of longwords" do you mean that you simply exchange the .l for .w in the movems? If you do, does that mean that the '020 can concatenate the 16 bit words into 32 bit ones before writing to memory? Is this a special feature of the movem.w instruction?

Anyway, the impressive numbers you get from the Falcon is of course because of the data cache. The read will not access memory after the first time through the loop. To make the test more realistic, try using post increment.

...
>Ok folks, that's all. No comments on this! I'm waiting for the figures of
>an Amiga 1200 with FastRAM...
>All figures can be easily checked by yourself!

I haven't checked your figures, but the benchmarks themselves are much more data cache friendly than any "real" programs. Also, all the programs fits in the instruction cache which is very good for the Falcon.
I'm sure this will cause the Amiga people to start running tests too. ;-)

By the way, I posted a bus speed test here during the summer. Has anyone run it on the A1200? If you missed it, I'll be happy to mail it to you.
The test wrote .5M nop:s in memory and executed them a hundred times or so. This probably gives a rather good indication of the bus speed since the cache will be useless.

Heiko Hartmann <zcam1121@rpool9.rus.uni-stuttgart.de> .......

> Personally, though, I feel vindicated because this proves the Falcon isn't
>the "dog" some people were saying it was. Although I'm hesitant to say it
>is 50% faster than the Ami in terms of raw CPU power. :)

Well, Its no surprise that the F030 is faster than the chipram
only A1200. It was only about 50% faster in one test though...
around 25% on avg in the others. Dont forget that adding fastram to
the A1200 typically speeds it up by 2x. This would bring it level in
that test and put it ahead in the others. I dont have Fastram on my
machine .. Yet ;-) so I cant do the tests, but someone should be
able to.

By the way, I have seen 3.84 MIPs quoted for the F030 and 2.96
for the A1200 with fastram. The tests would seem to indicate that
the 16-bit bus and shared ram do cut down considerably on the
actual delivered power as on CPU MIPs terms, the F030 would over
2.5x the speed in all the tests. Also, program size can influence
the cache hit rate - a small benchmark sitting almost entirely in
the cache may or may not be representative.

AFAIK C= arent continuing to make the A600 so they are just
dumping old stock to clear their warehouses. I think some of the
machines in apples range are in the same boat.

The A1200 is targetted at the home market as an Ideal cheap intro
for learners, and a cheap upgrade for A500 owners (A strategy
working well). Its inherently a `cheap` machine. Apple are selling
more upmarket models and have _had_ to slash the price to compete
with PCs resulting in unprofitability.

I never said the Amiga could do more than the Mac. There is no
doubt if such things count (and in the business market they DO),
then the PC has a far wider range of s/w and h/w than ANYTHING.
ergo, for the
business user the PC is by _far_ the better buy. For the home
market, this is not so relevent, but still important.

>"Amiga killers".

No, because the Apple mac is competing in the business market and
the Amiga is primarily for the home market. There is some overlap in
Video and Multimedia. Overall, the Mac certainly `kills` the Amiga
for business software : but the PC kills the Mac!

>(after all, wasn't it you who used the same logic to proclaim the Falcon was
>dead because the A1200 had sold so many more units? :) )

I think that its relevent to compare like with like sales. The
Amiga and F030 *are* competing and the A1200 is `killing` it as its
dominating the F030s market. My whole point was that `Sincrap and
Bullshit` are always claiming that the Apple is killing the Amiga
when in reality there isnt that much competition between the
machines. I was pointing out that buy PSD and MBs standards of
judging the Amiga, the PC will wipe out the Mac.

>Let's clarify this point: WHAT IS HOME USE? What would a home user
>demand of a computer that a typical PC user (not necessarily business user)
>might be better served by an Amiga?

>Is it games? Well, the PC has more games. Heck, go by a SNES for $89.

partly, the Amiga has I would say, a wider range of games than most
machines by virtue of its console-like hardware. The PC has more
games but mostly of the sim/ RPG type. The SNES has few good games
of this type, but the Amiga has a wide range of good games of all
types.

>Is it desktop video? Well.. many people still don't have camcorders even!

again, partly

>Is it music? Why the Amiga? Why not a Falcon...?

indeed, the Falcon is best for music

>Is it for programming? Well... anything could do for that if it appeals
>to one's hacker instincts.

Yes, anything would do (but i think programmers would prefer the 68k
machines)

>So, by your own logic, welcome to the orphanage. :)

I dont agree, I feel that the Amiga offers a wider range of things
for the home user, rather than the Mac which is very DTP orientated.
No business that I can think of would be better off using an Amiga
for business, that would be totally stupid as the PC rules supreme
in this area.

>>better bet than the Mac since the Macs increased business sales
>>count for nothing here. If all the Macs were bought for home use
>>then you would have a valid point. They werent, they were mainly
>>bought for the business market.
>>
>This just shows that Commodore (and Atari) both failed to get business
>market penetration. So they have to sell consumer machines which can
>beat the PCs in some aspect... perhaps video game consoles are where their
>expertise will pay off. Who knows?

This is more or less the point I was trying to make, except that I
was pointing out that Apple will end up in the same boat too. They
should concentrate more on home use.

>>Oh yeah? How are you going to display all the Multimedia stuff you
>>create with your overpriced Mac systems??? Are you gonna put an AV

>>be of use, you need to actually get machines into real life to run
>>your presentations on. At $400 a CD32 is a much better bet for
>>widescale distribution than a $5000 AV Mac.
>>
>Can you CREATE multi-media presentations on a $400 CD^32 which has no
>keyboard or hard drive?

Of course not (unless you get a keyboard and hard drive add-on ;-) )
However, once you make presentations you will have to replay them on
something and there is no cheap `multimedia player` option for the
mac. This limits its usefulness for wider, public applications.
You use an A4000 to create, and then press discs for the CD32.

>> *The mac will be EATEN ALIVE by the PC in the business market*
>>
>Probably true.

Oh yess, if Only PSD and MB could see this point........

>> I buy my computers to use at home and I WONT join the mindless
>set of people buying a PC because `everyone else has got one`.
>
>Wonder if Falcon owners feel the same way? :)

I`m sure they do. In fact, i`m sure most non-pc HOME users share
the feeling of `rebelling` against the PC clones. (including mac
users)

I'll agree with this. Let's get at least one A1200, with Fast-RAM, user to run these test, both with and without the instruction caches enabled.

|>
|> By the way, I have seen 3.84 MIPs quoted for the F030 and 2.96

|>
|> gavan

Actually 3.8mips, and 3.0mips are Motorola's numbers for the processors in each machine. Both processors can access memory much faster than they typically need it for most operations. Again I suggest we wait and see what the numbers come out like both with and without instruction caches enabled. Then compare the machines only with caches disabled to create a more level playing ground.

Brian

How about Word Processing, DTP (Flyers, invitations, etc), and Paint Programs.
Now show me programs that are at least as good as Excellence/Final Copy,
PageStream, and Deluxe Paint. Also make sure that I can get all 3 programs
for less than $400. Sure if I get a Mac I can copy all of these from work,
and many home users get their computer for this reason, but some of us like
to buy the programs.

>>Oh yeah? How are you going to display all the Multimedia stuff you

>>
>Can you CREATE multi-media presentations on a $400 CD^32 which has no
>keyboard or hard drive?

No, but if I want to make 1000 display units (Kiosks) would I want each one
to be able to create a new Multi-media presentation, or would I want an
A4000, with a big hard drive, and 1000 CD^32's. Is there any Mac that can
display a Multi-media presentation from CD that is portable, for less than
$1000?, $500. For that matter is there such a beast for the PC. The only
problem with this is that I doubt C= is making much money off of this beast.
They want to make the money off of the software. I am not sure how it would
work if I create my own software to run this thing for kiosks.

Later,

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Am I missing something here? The 68020 and 68030 both have a 256 byte instruction
cache so this shouldn't matter. Does the 68EC020 lack the instruction cache? This
would be a rather serious omission if this is the case, because the instruction
cache can have a significant effect on the speed of carefully written code.
The other benefits reported in the benchmarks seem reasonable, simply disable
the 68030 data cache before running them to see the effect of memory access.

Cheers

- Andy.

Well, since the entire point is to see how the Falcon is degraded by
its 16-bit memory access, using a cache defeats the purpose of the
benchmarks...

My point was that the Falcon would take a much larger performance hit if it had
to go to RAM to fetch the instructions because of its 16 bit bus. With the code
in the cache the only accesses to the bus are the data writes.

Probably true -- Atari is still rebuilding their dealer network.

>That zippy Mandlebrot demo sure helps me do my work faster (ray tracing,
>compiling, DTP, etc)... And it's one of TWO pieces of DSP software that
>I've heard of since the Falcon's 'release'... The other is the DSP JPEG
>software that people are licensing from BrainStorm.

The Mandelbrot demo is considered to be the best indicator of overall
system performance. Nobody would pretend it's a "real world" application.

>Who uses DOS?

Floppies and Hard Drives are "extras" on MS-DOS systems. The basic
input/output system (BIOS) in the ROM doesn't deal with them in
sufficient detail to make the operation easy or straightforward. That's
why you need a Disc Operating System (DOS). If you're using a disc,
you're using DOS.

>Good luck doing a ray-trace on a Falcon is < 1 minute for 320x200x24-bit
>colour. And don't try saying, "Yah, but re-write it to use the DSP and
>it'll rip!" Sure it would, but I'm not going to re-work several
>thousand lines of someone elses code just to get more performance; it's
>easier to just spend the same amount on money on a faster CPU (not that
>I would; I'd rather have 12M of RAM and a decent display, like
>800x600x16-bit).

It always takes some time for the software to catch up with new
hardware. When the original IBM-PC was introduced, there was a
very small list of applications that would run on it because it
wasn't an Industry Standard CP/M computer. A quick, quiet death
was predicted for the Non-Standard Hardware and Software.

Here we are years later, and most people don't even know what CP/M
stands for. And we're going through the same development cycle
again.

>Software will never be available for the Falcon. It's been out for
>what, a _year_?

The Winter 1992 issue of the International TOS Software Catalog ($12.00 from your local Atari dealer, or direct from Atari) is an inch-thick compendium of ST/Falcon software. Outside of the USA, it's about 2.5 cm thick. :-)

> There are very few applications that use the DSP, and
>there have been no more Falcon machines announced.

Good software takes time. And Atari, having been stung by "Vapor" announcements in the past, doesn't announce things until they're done. We could speculate on '040s or '602s, but it would only be speculation.

> I really don't care
>if Atari is concentrating on the Jaguar (hey, haven't they heard of
>multitasking?!?), but I don't want a console,

(This is an attempt to confuse me, right? :-) When did Jaguar enter this discussion? Well, I'll go ahead and answer anyway from a Falcon standpoint.)

Lessee ... the '486 @ 66 Mhz system ran the benchmark in 6 seconds, the Falcon ran it in 4 seconds. Do you really consider these systems to be consoles? If you do, you must desire something so advanced that it's not available on the consumer market, not just a mere....

>'040-based computer (with a decent case and a good keyboard; don't
>underestimate ergonomics!).

Amen on that good keyboard! If I could get a computer keyboard that felt and acted like an IBM Selectric I could *really* churn on my reports!

>> Because Atari programs are more compact then their MS-DOS equivalent,
>> an 80 Megabyte hard drive gives space equivalent to 240 Megabytes on
>> a clone. GEM doesn't require 4 Megabytes of RAM and 20 to 30 Megabytes
>> of disc space to operate. Microsoft Windows does require all of this.
>
>You really are dreaming. A good word processor, with lots of functions,
>takes up lots of space on any platform. Granted, nothing takes up as
>much space as Micro$oft apps...

I had 10K of "C" source code that compiled to about 5K on the Atari ST, but ballooned up to 19K on an MS-DOS machine. Sure, features add space, but the inefficiency of the clones adds unnecessary space.

>Don't you think your computer uses would benefit GREATLY from a
>multitasking OS? Not Windoze, something that really multitasks, like
>OS/2?

As an evolutionary development, yeah. And when I get my Falcon, I'll be running Multitos.

>Obviously, you can say, "My computer does all I want it to!" and I'll
>say, "Yah, eventually." I guess you don't care that Calamus isn't

>running terribly fast, or that your spreadsheets take a long time to
>calculate. Me, I don't like to wait for my computer.

When I see speed decreases, it's usually when comparing my machine
at home with my machine at work. It's pretty much a standing joke
around here that I can be seen tapping my MS-DOS box on the side,
saying "C'mon, c'mon, I've got an Atari at home faster than you are."

>pity Atari's never going to release another computer (after all,
>they're concentrating on the Jaguar now).

According to the Atari Annual Report, Atari considers itself to be in
both the video game and computer markets. They put a lot of work into
the Falcon, now they're putting a lot of work into the Jaguar (and
using it with the Lynx, as well!).

>> P.S.: In your followup (if any), please delete comp.sys.atari.st from

I might get burned for this but...
If MTOS/TOS works on my TT the same as the Falcon, and since its th same program I think this can be safely assumed. Then disabling the cache disables both the instruction AND data cache.

|> ...
|> >Ok folks, that's all. No comments on this! I'm waiting for the figures of

|> will be useless.
|>

Again let's see if any future tests are with the caches enabled and disabled.
Anyway since the Falcon does have a data cache, though very small, it is part of the standard system, though would invalidate these particular tests.

I fail to see the difference... do you think Commodore is making more
profit on the A1200 than Apple does on their mid-range Macs? I see
both companies making machines cheaper and selling them closer to the
margin in an effort to make market penetration. I think it is impossible
to say one is different from the other except that Commodore's efforts
are focused on < $1000 machines and Apple is focusing on $1000-$6000
machines.

>
> No, because the Apple mac is competing in the business market and

>for business software : but the PC kills the Mac!
>

But I distinctly remember you saying the A1200 is a "Falcon-killer".
Now, by your own statement above, if two machines are in different
markets, one can't "kill" the other, so that refutes anything you said
before regarding the Falcon.

<just being picky here>

So basically what I'm saying is your defense of the Amiga against the Mac
(which has sold better) is essentially the same as what the Falcon
advocates were saying when you touted the sales figures of the A1200
earlier.

> I think that its relevent to compare like with like sales. The
>Amiga and F030 *are* competing and the A1200 is `killing` it as its
>dominating the F030s market. My whole point was that `Sincrap and
^^^^^^^^^^^^^^^^^^^^^^^^^^

Since when did the A1200 dominate the MIDI market?

You show me where you see the major MIDI packages like Cubase, OMEGA, and Notator being ported to the Amiga, and I'll concede.

>Bullshit` are always claiming that the Apple is killing the Amiga
>when in reality there isnt that much competition between the
>machines. I was pointing out that buy PSD and MBs standards of
>judging the Amiga, the PC will wipe out the Mac.

And likewise, the PC would be wiping out the Amiga.

In reality, there is no such narrow definition of "killing" in terms of market. The larger markets will always prevail and their users will dictate that they want more diverse and more capable software. Whether or not the Mac competes against the Atari or Amiga or whatever, if it outsells us, it dictates to the software houses what platform they will support.

(in essence, i would say the PC is "killing" the Mac... and the Mac is "killing" the Amiga and Atari. By this definition the 1200 is "killing" the Falcon, too... on the basis of units sold to influence developers to support it...)

Now once we get beyond this senseless slaughter :) we can see that some people are drawn to "alternative systems" the way some abhor Top 40 for alternative music. It doesn't necessarily have to be the best, just interesting. If that's the case, noone is going to get killed as long as they maintain a devoted following among their users... and can "drag" them up to the next level each time they upgrade. Atari and Commodore have been doing this for years. When (or perhaps IF) they can't keep convincing users to stick with them, they will die.

Actually, that may be why Atari chose to go with the 68030 in the Falcon...
it had the built-in MMU (needed for MultiTOS/MiNT memory protection, but
not a concern on the Amiga), and had a built-in cache that on some cases
might make a big difference.... although it the '020 includes a
cache, does it not?

Why would you see 1000 kiosks in a mall. That would not leave a lot of room
for stores. Now picture kiosks in car dealerships, with info on all the
cars, or in airports with all the latest info on the area. All of these
are possible and would need a cheap medium to play. For that matter, what
about at museums. The could show history in motion as well as stationary.
>

Well, try PC Paintbrush 5+ for $100.

Total cost is actually slightly above $400.

(actually $35 more)

For someone who buys a PC for $1000 or so, is $35 going to make or break
them?

Ok next argument, one planet up....

Well, my whole point is... these kiosks you're describing are:

1) not something the average computer user (as far as I know, so perhaps I'm over generalizing) doesn't design multimedia for. Have you seen a large group of people doing multimedia for kiosks? Would this group be comparable in size, to say, the MIDI market?

2) not something present in a lot of places... yet. And when they are, the Amiga may be part of it, but until they become more widely used, i can't see this being something that isn't so specialized that the number of machines sold for this would be small, compared to the number of users who would be buying comptuers for general purpose use.

(although i can see where a contract for several thousand would be likely)

>
>No it is not the typical home use, but then again Wing Commander 2 is not
^^^^^^^^^^^^^^^^^^^^^^^
>exactly the typical business software, and yet IBM is considered a business
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

This is an excellent point. But this only makes the situation worse for those of us with alternative systems because not only do clones have the name recognition as business machines, but they are also adequate game machines.

>computer, not a game machine. C= is unfortunate in that they do not get the

The Toaster alone is an excellent reason to buy an Amiga. So is OpalVision.

>>

Who is Fred Fish? Anyways, my point is that the typical user doesn't do multimedia for kiosks and probably won't be doing CD duplication.

I guess what I'm saying is that it is hard for you to say in the same breath that the Amiga is a good, solid, cheap, computer but give examples of it that show it to be a specialized and probably expensive platform for said uses.

What did all of this have to do with the $400 for the 3 dream apps?

NOW for a shocker. Does anyone know what is the cheapest Amiga system that can use OpalVision? I am looking into this for a friend and might possibly acquire one myself.

(also need to know if there is a way to sync the video to music generated on an ST/Falcon which could be generating SMPTE....)

You are talking about the 3000GT. I like the styling of the Stealth much
better. They both have new 94 styles and the new 320 hp engine in the high-
end models.

The Eclipse is an excellent car for about $10k less. The GSX models gives you
190hp with AWD.

Never heard of this one either. Can it do Gradient fills, animation (It
amuses somepeople to play around with it, including me), and even half
the features I would like. Actually I should have worked this the other
way, because I need a strong paint program first, and a word processor
that can spell check, use a thesaurus, and print out. Basically the Paint
program has to be cheap and good.

Let's clarify this point: WHAT IS HOME USE? What would a home user
demand of a computer that a typical PC user (not necessarily business user)
might be better served by an Amiga?

Is it games? Well, the PC has more games. Heck, go by a SNES for $89.
Is it desktop video? Well.. many people still don't have camcorders even!
Is it music? Why the Amiga? Why not a Falcon...?
Is it for programming? Well... anything could do for that if it appeals
to one's hacker instincts.

[Deleted lines]

I give the examples of good cheap (see prices above), and how it can be
specialized. What is the point in a good cheap computer that can not do
anything professional?
>
>What did all of this have to do with the $400 for the 3 dream apps?

Home machines should have home software prices, unless they are expecting
everyone at home is pirating it from their office, and they should only make
their money from the office.
>
>
>NOW for a shocker. Does anyone know what is the cheapest Amiga system
>that can use OpalVision? I am looking into this for a friend and might

True about the space requirements ... I saw the WindowsNT distribution
package at CompUSA the other day (I was buying generic diskettes),
and the minimum requirements were 70 Megabytes of disc space and
12 Megabytes of RAM. That's just to get started.

OS/2 isn't quite so bad: (just guessing, here) it requires 40 Megabytes
of disc and 8 Megabytes of RAM. Just to get started.

MultiTOS requires *lots* less: 10 Megabytes of disc and 4 Megabytes
of RAM (according to my local Atari dealer), and that's allowing for
a "lot" of RAM to run a "lot" of applications. BTW -- the dealer points
out that MultiTOS does true multitasking, in that all applications get
a share of processor time. Apparently, Microsoft Windows doesn't have
this feature.

Actually, OS/2 requires ~35 megs of drive space, and will run in 4 megs of RAM (But 8 works a whole lot better). However, the 35 megs includes the full installation - it includes the OS/2 operating system, a full implementation of DOS 5.0, the full version of MS Windows 3.1 (Win OS/2), and several nifty little applets. OS/2 by itself takes ~17 megs of drive space if you can live without DOS and Windows.

MultiTOS sounds nice, my only complaint is that I can't find software locally for the Atari anymore. It seems somewhat pointless to have a multitasking envirionment with virtually no software to multitask :)

^^^^^^^^^^^^^^^^^^^^
Wonder where he got this number from? In my MultiTOS folder
there are 11 items, at under 405k. Say an even 500k for whats in
the AUTO?
Now, this is straight out of the box from Atari. There is just
one distribution disk for MTOS...
On my 84mb (standard) drive, I have 66mb free - thats after
installing all the distribution disks: the language disk, extra
programs, MTOS, Works, SpeedoGDOS, a non-Atari looking disk labled
'Falcon software' (including AFM, D2D, etc).
Also installed is the ScreenBlaster software, plus a few
other choice programs.
All this, and its taking up less than 20mb.

>of RAM (according to my local Atari dealer), and that's allowing for
>a "lot" of RAM to run a "lot" of applications. BTW -- the dealer points

>a share of processor time. Apparently, Microsoft Windows doesn't have
>this feature.

RAM is a problem on MTOS, as any multitasking system. 4mb
is just NOT enough... After booting MTOS, I have about 500k left
of usable RAM!
I am waiting for the fake RAM price hike to fall off before
I start looking for a 14mb board...

And on the topic of multitasking systems, and word on
Linux-68k for the Falcon? (and puhleeeze dont give me any
stuff about 'the falcon aint powerful enough')

Just out of curiosity, I notice some people preferred to pick up A3000s
to A4000/30s with AGA. And what is this whole "Buster" chip thing with the
4000?

(an A2000 would be totally useless... because it'd be too slow... but an
enhanced one or an A3000 would be nice...)

> Am I missing something here? The 68020 and 68030 both have a 256 byte instru
ction
>cache so this shouldn't matter. Does the 68EC020 lack the instruction cache?
This

AFAIK, the 030 has both data and instruction caches but the 020 has
only an instruction cache. Also, I think the 030s caches are 256
bytes but the 020s is only 64 bytes????

I think the MultiTos idea was good for the tests as lets not forget
that a multitasking OS imposes overheads. Not just that, but also
multitasking tends to gronk caches as the `locality of reference`
thing goes out of the window...

Hardly suitable for home users (Ami Pro takes 15 MEGABYTES of HD
space!!!!!! - Do you wanna waste that just for a wp?).
These programs are large and slow on anything but a fast 486.
They have tremendous requirements for ram too. They are excellent
for business but way over the top for home use. Lets not forget they
are totally expensive too, unless you pirate your copy from work as
most PC users seem to do.

>machines.

The difference is that Apple are selling expensive (relatively)
business machines whereas C= with the A1200 are selling an
inherently cheap home machine. Apple were forced to slash prices in
order to compete with the clones. The clones just keep getting
cheaper and cheaper, do you think apple can keep slashing their
prices in line???

>> No, because the Apple mac is competing in the business market and

>Now, by your own statement above, if two machines are in different
>markets, one can't "kill" the other, so that refutes anything you said
>before regarding the Falcon.

But the A1200 has to all intents and purposes killed the Falcon
in the home market which is a very important one to Atari (It still
has the music market). AS far as business goes, I think the Mac has
been an `Amiga-killer` as it has prevented the Amiga getting
accepted in the business world. However, it has yeat to kill the
Amiga in either of its main markets (Video or home - home is only
relevent in europe as the PC and consoles killed the home market in
the US).
This is all getting really silly, x killed y etc. My point was
that the Mac is doomed in business sector in the long run and it
better look for new markets. Actually, I was just trying to make a
point against Sinclar-Day and Barett who continually pollute the
group.

>So basically what I'm saying is your defense of the Amiga against the Mac
>(which has sold better) is essentially the same as what the Falcon
>advocates were saying when you touted the sales figures of the A1200
>earlier.

I was pointing out that the Amiga has bettered the Falcon in the home market. That home users as a result couldnt expect much in the way of software support. The thing was that no matter how good the Falcon hardware was, the low sales meant that you couldnt expect to see as much software as you would like. In Europe, the Mac certainly hasnt bettered the Amiga in the home market. Its all relevent and market dependant.

Anyway, nothing I say or do is going to make Falcon owners switch to Amiga. I wasnt suggesting that they should, just that _prospective_ buyers should check out the advantages that the A1200 offered.

Anyway, the rest of the post could be answered in similar ways. Its all down to market perception. Heres my `Computer Food Chain`

Lines: 41
Distribution: world
Message-ID: <26qchl$697@zaphod.axion.bt.co.uk>
NNTP-Posting-Host: elephant.axion.bt.co.uk

I have had my CD32 for 2 days now and I am very surprised that none of
you other new owners have posted any comments about it yet. Here are
mine:

I was unhappy when I first heard that there would be no RGB output port
on the console, but after seeing the quality of the composite video
output I am no longer worried. Picture quality is very good via this
connection.

It is very unlikely that anyone would want to buy the CD32 primarily
as a CD player, and although I am sure it would not compare with a good
hifi player, I am surprised at how good the quality was when connected
to a reasonable amp. I only wish I could find a 'CD+G' disc to try out!

The games supplied (on 1 CD) are Diggers and Oscar. Oscar is a very
playable platform game set in 7 cinema theme 'worlds', each of these
worlds comprising a number of levels. Scrolling is very smooth, and
the use of 256 colours give some excellent parallax scrolling backgrounds.
One problem might be, that in an effort to go for the 'wow look at those
graphics!' reaction, everything is a touch too 'busy'. I occassionaly
find it hard to pick out some of the nasties from the background.

I can not comment much on 'Diggers'. It appears to be quite a complex
game, and I have not made time yet to learn the meaning of all the icons
etc. The general look of the graphics is not as stunning as Oscar, but
it does contain some very eerie CD tracks which are played throughout
the game.

Neither of the games contain examples of the more basic Full Motion Video
sequences that the CD32 is supposably capable of without the add-on FMV

-unit. Bye the way, does anyone know if there is to be any hardware/ software released to allow Kodak Photo CDs to be used ? I read that the CD32 hardware is capable of reading the format, but the software is not built into the machine due to some last minute licensing problems.

I am now waiting with much anticipation the arrival of Syndicate on CD and the first proper issue of CD32 Format magazine - I am very interested in the contents of the coverdisk !

Source record: 21609

Hey all, here's something to argue about: the supposedly soon to be released Amiga 5000. Get this:

68060 cpu
two 68040 cpus (yes, three 680x0's!)
maximum resolution of 4096x4096 with 32 million colors on screen
16bit sound
8 expansion slots
and, is supposedly capable of running Windows NT and Unix.

Don't get me wrong; I've been into Atari since '83. But, if those nuts at Commodore can come up with this, why can't Atari get on the ball. I'm thinking more of engineering, not sales. We all know that Atari has a hard time getting product to the stores.

Commodore must have something up its sleeve since you STILL don't find that many Amiga users around (at least not the people I know-Los Angeles and Irvine California)....

Hasta,
Matt Koundakjian

I think the A5000 rumors have been kicked around to death in Amiga advocacy...
It doesn't exist. It won't exist...at least not as descibed above.

I'm sure C= has some R&D people thinking up ideas fo the next generation
Amiga... of course, Atari is probably spending some resources on a next
generation Falcon. How much resources both are setting aside for that is...
well....up in the air. :)

Incidentally, there already is an A5000.. the Archimedes 5000. :)

I'd agree that this is the "computer food chain". But my point is... Every single time a machine is sold by a clone company, they are further entrenching themselves and that affects the Amiga whether it is a home machine or not. The same goes for the Mac... they have enough market share that they cannot disappear overnight.

I think software companies don't look at it as a "home" market vs. "business" market here in the USA because machines sold for business just as likely wind up in the home. We have Sears stores selling clones. Not Amigas.

So I think like it or not, we can't delineate the "intent" of the computer from its market. Heck, in a sense I'm saying the Falcon is one potentially dead puppy. :) But I think the main thing here is that the Amiga can't "kill" the Falcon... just like I wouldn't expect the Falcon to kill the Amiga. But the PCs and Macs *could*.

Every single computer magazine and everysingle word processor review ranks Ami Pro No1. Everytime. Above word, above Describe, above WordPerfect...

Also, I think some ofthat space is for a huge disctionary/thesaurus/grammar checker. NOTE: Don't you trhink it is possible that Ami Pro's dictionary is... 'different' than the one for the WP that fits on a floppy? In addition, Ami Pro has _clipart_ out the wazoo, so I've heard.

When you add up the system cost for an A1200, the price will exceed the price of some mac systems. Every computer firm is slashing prices except for C= in this country. Why can't Apple slash prices and still make a decent profit. Apple comes ou with new models, because cost savings are always found. Since Apple sells millions of Macs each year, their component costs are much lower.

Well, I took the time to study the benchmark programs. Were you serious
about them???

1. The code fits in the cache (both 1200 and F030).
2. The data fits in the cache on the F030.
3. In the first benchmark you can't just exchange all memory references
from .l to .w and expect the result to be the same. Using .w takes close to
twice as long time.
4. You should longword align all branch targets and data. (I expect the
F030 would loose(sp??) less if not longword aligned.)

I also suggest that benchmarks should be run with all multitasking and
interrupts off, and then with all on.

(No, I don't have a 1200, I just tested on my 2000.)

Yeah, so you EITHER want a 60 MHz 040 OR a 65816, an 020 won't do? Heard of the term "cost-effective"? Well, it ain't cost effective to have an 040 in a games machine. Maybe soon, but not today.

Who the hell cares? It's a CUSTOM CHIPSET, therefore it is CUSTOM. You said it wasn't.

>Hasta,
>Matt Koundakjian

Personally I think that the 68060 will be very expensive when it's released (if somebody got some info about the '060 can you please (!!) send it up) and therefore the Amiga 5000 will be extremely expensive especially if you add two '040.

Then we have this resolution 4096x4096 24bit palette and probably eight control bits which gives 32bit per pixel. Let us now think a little 4096x4096 32 bit per pixel gives that one screen would take 67Mbytes and to get some quality the update frequency on the screen should be at least 60Hz which gives that the video chip must read 4Gbytes each second. Let's say Commodore use 64bits access to the memory which then gives that the new Agnus must run at 500MHz . Have you heard about the Alpha processor ,it ru

ns "only" at 200MHz but uses 30W which is the same as little lamp (perhaps you can use the new Agnus to boil tea at).
Perhaps Commodore have expanded the bus to 256bits then the bus just have to run at 126MHz but then you can't write to the screen because of there is no buscycles left. One way to deal with that is to increase the busfrequency to 251MHz and then you can start boiling tea at the Agnus again. To say the least :
"I'm doubtful"(perhaps am I totally wrong ,perhaps Commodore has comed up with some new radical technique ,perhaps Commodore have recieved help from Aliens to construct the Ultimate-computer-that-will-outsell-even-the-PC-and-send-the-MAC-to-an-early-grave).

I'm no hardware expert but the little knowledge I have about busses and processor tells me that it's not one easy task to design such a computer as the rumour says Amiga 5000 is and even if they succeded I can tell you that this computer will be expensive and some for Pentagon rather than for the home-user.

P.S. Under the 'Motorola - inside' convention this summer I met up with several Falcon owners and one of the was Blade / NewCore , he made some tests (when I'm was watching) that copied data first by using words and it wasn't a loop but a long row of move.w (a0)+,(a1)+ which didn't fit into cache and then we justified the amount of data we copied so it took around half the raster time. Then we exchanged the .w -> .l but didn't remove any moves i.e. we copied twice as much. This added around 10 rasterlines

which gives that a 32bit read/write isn't much slower than a 16bit read/write. But it also showed us the Electra was right ,one read/write (no cache) takes (arrrrghhhhh!!!) around six buscycles. And perhaps because of that I might not buy Falcon but an A5000 instead and it's not Amiga 5000 I'm talking about but an Archimedes 5000 (it's the DSP that I like about the Falcon). D.S.
P.P.S even I think I can tell the diffrence between an 24bit picture and a Ham8 picture because I saw some Ham8 pictures at the local computer club and I was not impressed (not at all actually) D.D.S.
P.P.P.S Even if I'm a atari owner I just wan't to say something about Jaguar: "I wan't to see it to believe it". D.D.D.S

Maarten Range.
e-mail : d3marten@dtek.chalmers.se

Last word : I've heard something about a DSP called 3210 that according to a friend of mine will beat the sh-t out of the 56001,if somebody got some info I would be very happy .

> your point .. NOT ...

Say what? If 24-bit is True Colour, then 32-bit will OBVIOUSLY be True Colour. The Falcon's Hi Colour mode, however, is 16-bit. Now, I'm going to explain this slowly:

16 bits are LESS bits than both 24 bits and 32 bits. That means that if 24 bits is the limit for True colour, 32 bits (being MORE than 24 bits) will ALSO be True Colour; 16 bits WON'T be True Colour, since 16 bits is LESS than 24 bits. Okay?

Also, if you had actually READ Stefan's post, you might have noticed (although I'm starting to doubt this) that Stefan said that 24 bits was the minimum True Colour mode.

> SB> Do that. You'll find that you're the one who's wrong. If you can't take

|>
|> Sounds like he's a little nervous to me.

Boy! I agree. Now I would give him credit one one little thing only: it seems that the '64-bits' of the Jaguar are not true '64-bits'. Let me explain before the flames and let me remind all the guys around here that I like the Jaguar.

Apparently what ATARI is doing is what Intel is doing with its Pentium (TM): they get 64-bits of data and split it to the appropiate units (in this case, inside the Tom chip) and inside the Tom these bits are used by the object processor and the graphics processor. Apparently the graphics processor is not 64-bits but 32-bit.

Again, please no flame and I admit that I have no concrete information that definitvely and without any doubts confirms the above. I would say that anyway, if the Jaguar can do a 'Star Fox' alike game wiht 3D texture mapping all over the place, it is awesome even if it used 8-bits :-)

True.

|> >
|> >Incidentally, for those who care, Beta was actually a superior format to VHS.

He he, true. But the one that got the actual acceptance was VHS. Superior != standard or very popular, and the games market is very unforgiving with unpopular systems.

Jason, what's up with you? I can't believe this is still on. The CD-32 is based on the AGA chipset and the 68020, it is an A1200 inside of it. The 'it's like an A500 with improved graphics and a 32-bit CPU was said like an analogy.

|>
|> 68EC020

Wich has a full 32-bit data bus to memory. It is exactly like
an '020 except that it can only address 16 megs. What about the 16-bit
data pathed '030 in the Falcon?

|> 256 colours (any graphician knows HAM is useless)

I use my machine for 3D animation, and if it weren't for Ham8,
I wouldn't consider having the machine. To say that HAM is useless
is to show ignorance.

Ham8 let's you have virtually undistinguishable 24-bit screens with
1/3rd of the memory requirements with fullscreen animation.

----------> BTW, let me remind you that the A1200 has sprites and dual-playfields
which are darn essential for games. The Falcon doesn't.

|> 8 bit sound...

Ah, that one is true. The Falcon is a very nice music computer, nothing wrong with that.

|>
|> Hehe ... there are more Falcon owners than A1200 owners here .. guess why?

Because you lie. It isn't true.

Benchmarks have been disregarded a looooooooooooong time ago here. A small benchmark would prove nothing, as it may even reside entirely inside the '030 cache. Hey, even the A1200 '020 has no bus contention with some benchmarks and looks really fast even in 1280x400+overscan+ham8.

Check out a real application.

I don't disagree that the DSP is *DAMN* fast. Problem is that for a general purpose application (read word processor, DTP, database, etc) the '030 has to do most of the job big time.

I think you couldn't. You'll have to close examine them big time. The reason
is that Ham8 unlike the original ham uses 64 registers instead of 16 *and* since
it can be done at a higher resolution sometimes the 'carry data over' looks more
like an antialiasing pixel than anything else.

|>
|>
|> >HAM8 = 260000 colours using only 8 bitplanes (upto 1280x512 + o/s)

Atari has claimed a lot of things that usually don't make much sense. You can't have burst mode among other things.

SB> >What do you call 32bit col then?
SB>
SB> If you had read what I wrote a bit more carefully, you would see that
SB> it is called "True Colour".

Ah! So Everything except the Falcon's True Colour mode is True Colour .. I see your point .. NOT ...

SB> Do that. You'll find that you're the one who's wrong. If you can't take
SB> that, you'll have to educate the rest of the world about the new
SB> definition
SB> of True Colour ;^B

I've seen it in so many places before, I don't think I'll have a hard time digging up a reliable source ..

SB> >Exactly. Typing/Programming/Exploring/Learning ... anything EXCEPT
SB> playing
SB> >games which is what GAMES CONSOLES was designed for ..
SB>
SB> That's not "work" - that's playing around. Nothing wrong with that, but
SB> it doesn't generate any money. Nothing wrong with that, either, but money
SB> is nice for buying stuff.

Oh, then I should just throw the money away I've made "playing" with my computer .. too bad ..

SB> Well, I wish you good luck with it then. Chances are it will be a
SB> massive
SB> disaster for Atari, but it might be successful - who knows? If it's a
SB> success we will probably develop stuff for it, too. I don't have anything
SB> against Atari per se.

A 64-bit console, blasting EVERYTHING on the market (including arcades) away, selling for $199 ..... DISASTER?

SB> I'm sure Falcon games sell over 30,000 copies. Especially considering
SB> less
SB> than 20,000 units have been sold ;-) If you expect to have any financial
SB> compensation for your work, making a Falcon game isn't quite the ideal
SB> choice.

Since I don't work for this BIG company with 10000000 emplyees, I don't have to sell 30.000 copies .... Let's say I make only 50 SEK on each copy myself, and that it sells 1.000 copies .. that's 50.000 SEK .. while it may not be much for

a big games company - I'm very satisifed with it.

SB> If you had the choice of making $4000 on a Falcon game, and making
SB> $100000
SB> on the same game on the Amiga, which would you choose? (Somehow, I know
SB> you're going to say Falcon ;-)

Too bad the Amiga doesn't have the capabilities then.

SB> Not that I have the time to prove it, but it's possible. You can of
SB> course
SB> not rotate all the graphics in real-time, but that's not necessary when
SB> you
SB> have 2MB of graphics RAM. Given the rather simplistic graphics in that
SB> game,
SB> I'd say it wouldn't be too difficult to pre-calculate all ground textures
SB> and then just blast them onto screen with the blitter. I have even seen
SB> similar things done on the good old A500.

!!! .. Now I know you're WAY OFF ... ofcoz demos can trick you into thinking
the machine is better than it is (ever seen an STE demo using tricks?), but
there's absolutely NO WAY you can do ANYTHING near FZero on the A1200 .. and
DEFINITELY not by pre-clac the graphics!!!

SB> I find it hard to believe that you can do it in realtime on your Falcon,
SB> either. The DSP is fast at some things, but unfortunately bitmap
SB> scaling/warping isn't one of them.

There's a demo out called "Speeder" which does EXACTLY this.

SB> No. In the LATEST issue. BTW, they didn't exactly declare Commodore
SB> dead, either, they simply said that they had had to lay off a number
SB> of people - just like IBM and Apple.

..and that C= was on the very edge of bankruptcy a few months ago, and that if
the CD32 didn't became the best selling console ever (which it won't be with
that lousy hardware) Commodore would DIE ....

SB> Too bad for him. I know no A1200 owner who isn't pleased with his/her
SB> machine. Maybe your friend just had too high expectations? That can

Yeah, he's seen my Falcon.

SB> happen with any machine if you have unrealistic expectations. Or maybe
SB> he just doesn't know what it's capable of?

Ahrm .. he knows ..

|> >STARE at pictures .. I want them to MOVE .. impossible in HAM8!)

Sorry but I can't resist jumping on this too.

Listen kid (not you Stefan!), I have an A1200 computer with wich I have
done animations in 2, 4, 8 ,16 , 32, 64, 128, 256, ham, ham8 , etc.

Animation in HAM8 looks like a 24-bit animation. I do this on a twice
a week basis. Are you telling me I can't do what I usually already have been
doing?

|> This statement only proves that you never have seen any HAM8 animations,
|> or that you have seen the output of some crap 24-bit picture viewer (like
|> ViewTek). If you had seen 24-bit pictures viewed with ImageFX or ADPro,

|> only choose from 65536 ...

WHAT IS UP WITH YOU? YOU CAN PUT over 262,000 colors (from a 24-bit palette) on the screen *and*
animate! What's up with you? If I had to do the videos I do with the Falcon they wouldn't look as good.

|>
|> GM> Then look at some ham8 animation. I douby current arcade games
|>
|> Full-screen

Full-screen animation? Yes, I have done it. 30 fps with overscan in the 320x200 (256 PAL) resolution, and 15 fps 640x400 (x512 PAL) + overscan, all with *huge* deltas using Scala's optimized 32x format. This is with my '030, the Amiga 4000 does even better.

|>
|> GM> could benefit substantially from any more than 256 colours. The

So you agree with something that you denied before (moving Ham8)?
I see...

BTW, how do you make your shadebobs? Sounds like you have to limit the number of colors when you do a shadebob (or at least what I consider a shadebob).

Ah, and try doing 64-bit wide sprites on the 65536 colors on the Falcon... ah, you can't.

|>
|> Haha .. [big laughter] .. they've seen an A1200, they've seen my Falcon ..
|> they'll NEVER buy an A1200 ...

That doesn't explain why the A1200 has been a big success and the Falcon
a flop so far... you know... someone published the Falcon numbers around here
in a posting and surely they ain't good looking.

|> (BTW; show me how you can expand an A1200 to the
|> same amount of hardware and flexibility as the Falcon for the same price .. that
|> DON'T add up!)

Ha! Easy: for the same Falcon price I can get an A1200 with a 50Mhz 68030 with
hardisk and 50Mhz 68882 FPU *and* 4 more megs ram for having a total of 6 megs
of Ram. Any questions? (Still the Falcon would be better for music)

|> GM> Certainly well in excess if 100 000 in the UK. I believe it has
|> GM> sold very well in Germany too. I`d say that 250000 this reasonable,

|>
|> Hard facts: DMZ (a Commodore paper in sweden) stated that *5000* A1200s had been
|> sold here. (And that Commodore is dead BTW)

Hard facts: the A1200 has sold over 200,000 units - Sweden is not Europe or the World, you
know.

someone posted that the Falcon has sold very little, and this is
one of the reasons ATARI would have less cash now to advertise the Jaguar.

In the US the A1200 has sold very little, the Falcon... well, are there out there more than
10?

|> (which has 32 bit and 32Mhz access to FastRam)?

Because, as I clarified to you on a posting above, you are relying on stupid benchmarks. Small benchmarks will be very influenced by the '030 caches.

|> Where do you find any crippled busaccesses in those figures?

Read above.

|> Oh BTW; I have a 16Mhz 68000 STE, if what you said is true, my Falcon would only
|> be 1-1 1/2 the speed of that one ... well . it's 3-4 times faster ..

No. The 68030 has other optimizations too, and again, it depends on what stupid benchmark you use.

Believe me, on a small cache like the '030, a real application doesn't benefits as much as you think. I have been using a '030 for over 2 years now.

|> Sure, the A1200 will be faster when moving from and in memory - so i hope

|> Yes I want a faster processor .... but I don't NEED it ..

Hey! According to benchmark, my A1200 with my 50Mhz '030 is
faster than an A4000 (68040) in 7 of the more then 15 tests.

On real applications I get from 50% to 80% the performance of
an A4000 (usually about 50%->60%). Gee, benchmarks are really
good to compare performance, aren't they?

|> No Amiga has the POWER to come CLOSE to that!

Puh. I can display a dual-playfield with 16 colors on each, with a 24-bit color sky (no banding, as it would happen on the Falcon), and ton's of hardware sprites on front (4 64-bit wide 16 color sprites) and parallax scrolling and say the same about the falcon.

|>
|> GM> TRUE COLOUR is **24 bits** not 16 bits. Neither the F030 or A1200 have
|>
|> Sorry, True Colour is by DEFENITION a graphics mode WITHOUT a palette, as in the

|>

Not that we are ever going to solve this difference in semantics, but...

Don't quote me on any of this as it is from the depths of my poor memory.

I believe that the company to first use the term (and perhaps trade mark it) TrueColor in fact only was using 14 bits, but the significance was the lack of a color palatte. I have no idea what the name of that company was (okay, there goes my credibility - this is only hear-say from memory).

I don't know any other definition of True Color other than live and in-person, see-it-for-yourself, in-living color (ie not computer generated). There has been much debate over how to actually quantisize true color. The term you use to refer to 24 bit or 32 bit or whatever bit color is merely market-speak and has no real definition (other than a multitude of people who mean 24+ bit color when they say true color).

So, therefore, when Rickard or some other Atari fanatic says the Falcon has true color (and yes we all know it is 16 bits) what they mean is that it has this 16 bit color mode which does not use or require a color palatte.

Now, could someone please explain what that means :-)

RandyH

|> would you not then have to process the _entire_ image to arrive at a
|> new optimal 64 base colours?

You can have a general purpose 64 base colors. Looking in 640x400 (or x512 Pal) makes the fringe almost unnoticeable particularly if you are doing an animation at 30 fps. I have seen it, believe me.

|> And wouldn't each pixel take more time to

|> A1200 deals with it. Or am I completely wrong about this - does the
|> A1200 have some form of special processor that could automatically
|> reoptimise the 64 base registers for a changed image?

No, it doesn't. But then, if you are going to play an Mpeg you will use custom hardware to decompress it anyway. This custom hardware could have that or even a new graphic chip set (seems to be the case for CD-32). BTW, Gavan talked about full screen animation that changes, not Mpeg, wich is something I have donde easily with Scala. In this case, the 64 color registers can be changed every frame, so fringe is kept at a minimum anyway. No problem, I have done this.

|> >Also, the way HAM8 works actually acts
|> >as a form of anti-aliasing(!) Its true, I`m suprised C= didnt try to

It is usually desirable, at least when working with animation.

|> From what I know about HAM8 (correct me if I'm wrong), the effect will
|> be a bit unpredictable from image to image, depending on image content and
|> what your base registers values are set to. I would doubt if this effect
|> will be very useful in the majority of cases, It will certainly affect
|> image fidelity.

Not in the case of Ham8. Since you have 64 registers there difference
between a 24-bit image and ham8 are nearly indistinguishable. This is
even totally so when animating.

|> Of course, quantising an image into HAM8 or the Falcon's 16 bit mode will
|> affect image fidelity anyway :-).

You should look at a 24-bit file rendered in Ham8 with ImageF/X or
AdPro.. then tell me... :-)

False: You are missing the CD-32 Sprite Engine, Dual Playfields, Copper Processor and the Blitter.

Some games could be better on the S-NES other better on the CD-32. In general I would expect the CD-32 to be better thanks to the 'unlimited' storage when compared to the S-NES.

>

Maybe you aren't looking hard enough. I disagree except for
flight simms, but that's to be remedied soon. SSI produces many
wargames and RPG games for the Amiga. Enought that I couldn't purchase
them all. I suppose having 20 some versions of King Quest type games
is something to boast about. How many of each venere of game must
we have to be satisfied. As of now, nothing can beat SpeedBall II for
the Amiga. I give it an easy 500+ hours of use on my computer alone.
I find this number of games argument lacking. Unless you mean total
number of pirated games in use. This is what the world has come to. :(

Yes, it's the DSP that C= are supposedly putting on their Zorro III
board. It should ship with headers for emulating a modem, speech
recognition, realtime audio effects...

|> Loss caused by Longs instead Words: F30 -12%
|> A1200 -16%
|> Overall: The F30 is about 34% faster than the A1200 in this benchmark.
```

Problems that still make your benchmark not reliable:

1. Benchmark is short. Fits entirely inside the instruction cache
of the '030, and some data inside the data cache. In this benchmark
the effects of the cache are just too generous.
2. No mention if the '020 cache of the A1200 was turned on or off
3. You didn't try the benchmark with words on a lower resolution, less
colors mode on the A1200 and F30.

```
|> ------------------------------BENCH2-------------------------------------
|> bench2:
|> move.l $40,d6
|> loop0:
|> move.l $ffffff,d7
|> loop1:
|> movem.l buffer,a1-a6/d0-d5
|> movem.l a1-a6/d0-d5,buffer
|> dbra d7,loop1
|> dbra d6,loop0
|> rts
|> buffer:
|> blk.l 20
|>
|> This is a test of memory-movement.
|>
|> F30 (640x240x256 60 Hz): 48.6 s
|> A1200 (640x240x256 60 Hz): 126.1 s
|> dito with forbid(): 124.2 s
|>
|> Now with words instead of longwords:
|> F30 (640x240x256 60 Hz): 34.3 s
|> A1200 (640x240x256 60 Hz): 68.8 s
|>
|> Results:
|> Loss caused by longwords instead of words: F30 -30%
|> A1200 -45%
|> Overall: The Falcon is 55% faster than the A1200 in this benchmark.
```

Problems that make your benchmark not reliable:

1. Again, benchmark is short. Fits entirely inside the cache (both caches)
of the '030 of the Falcon. Here the effect of non-reliability is even
*more pronnounced* as all the data can fall in the data cache with

no problem, since the buffer DOES NOT CHANGE.
2. Again, no mention if the '020 of the A1200 was on or off
3. You ran *ALL* the benchmarks in at 60Hz, which the bus contention
on the A1200 starts to make a stronger mark. If you had Fast RAm
the results would be damn different.

```
|> ------------------------------BENCH3-----------------------------------
|> bench3:
|> move.l #$40,d6
|> loop0:
|> move.l #$ffffff,d7
|> loop1:
|> move.l buffer,d2
|> add.l #10,d2
|> divu #10,d2
|> move.w buffer,d3
|> or.w d2,d3
|> cmp.w d2,d3
|> move.w d2,buffer
|> move.l d3,d1
|> muls #20,d2
|> movem.l d1-d3,buffer
|> lsl.w #3,d2
|> sub.l d2,d3
|> cmp.w d2,d1
|> bchg #0,d2
|> move.l d2,buffer
|> dbra d7,loop1
|> dbra d6,loop0
|> rts
|> buffer:
|> blk.l 10
|>
|> This is an enhanced version of bench1 (with logical arithmetics, shifts,
|> bit-operations, comparisons etc.).
|>
|> F30 (640x200x4 60 Hz): 38.8 s
|> A1200 (640x200x4 60 Hz): 48,4 s (with forbid())
|> F30 (640x240x256 60 Hz): 42.5 s
|> A1200 (640x240x256 60 Hz): 54.5 s
|>
|> Results:
|> Loss caused by higher resolution: F30 -9%
|> A1200 -11%
|> Overall: The F30 is 22% faster than the A1200 (relativly to A1200).
```

Problems that make your benchmark unreliable:

1. Again, benchmark is too short. Fits entirely inside the instruction cache
and some data is cached on the data cache. Again, a real-life situation
is not so forigiving!

2. Again, no mention if the icache of the '020 in the A1200 was on or off
3. Same comment of running @60Hz with no fast ram.

|>
|>
|> Ok folks, that's all. No comments on this! I'm waiting for the figures of
|> an Amiga 1200 with FastRAM...
|> All figures can be easily checked by yourself!

I did, check my comments. The information you present is not reliable. Did
you see what happened when you turned the Falcon caches off? The machine
ran 75% slower in the first test. If you are telling me that on a real-world
application (Word processor, DTP, Database, etc.) you gain 75% more speed
on a '030, I have a bridge to sell for you.

Look down below and you'll see that I'm using a '030. I have seen that
the best I have obtained on my accelerator is about 20% with an average of 8%<->12%.

Yep. So those benchmarks weren't run in a Falcon multitasking environment?
Let's talk about 'objectiveness here' Heiko.

|> Personally, though, I feel vindicated because this proves the Falcon isn't
|> the "dog" some people were saying it was. Although I'm hesitant to say it
|> is 50% faster than the Ami in terms of raw CPU power. :)

Flip, I like you because you are among the few Atarians that are objective.
I would say anyway that watch out with those benchmarks anyway and take them
with salt because the caches are playing a role there that usually they don't.
Like I said on a reply, the caches are doing the machine 75% faster on the first
benchmark (Falcon) which is something that I would wish to be true considering
I have a '030 machine. This is *obviously* not true on a real-application.
If you had a '040 the caches (since they are bigger) start playing a much bigger
role. I think that not even 75% even with the '040 caches...

Yes. The point is that 1) Heiko doesn't mention if he's using the '020 cache
and 2) In a real-world application, the cache will not save the '030

True. But the deal is in that on those benchmarks the '30 of the Falcon
benefits *big time* since those benchmarks fit almost entirely in memory,
something that is not true in a real-world application. Same will go
for the '020 in the A1200.

Okay, just for perspective, the C64 didn't have a colour pallette either.
Anybody here want to claim the 64's 16 colours to be True Colour?

The 3210 is the DSP in the *currently shipping* (cough! cough!) Macintosh
Centris 660AV systems. :)

(i've been hearing about the 3210 add-on for the Amiga since before the
Falcon was released... it still hasn't happened.. it may still come out,
but it sure has been a long time...)

WF> True colour is a Trade Mark. In what way does a falcon not have a
WF> palette?

In the 16 bit mode you don't choose what colours the palette you're using
should have, you just do a "move.w %1010101010101010,(a0)" to display one
pixel, where you have 5 bits red, 6 bits green and 5 bits blue.

In the 2,4,16,256 colour modes you can choose from from 18 bits when doing the
palette though.

WF> Last time I looked it had 16bit high colour, which for certain
WF> applications
WF> is better than 8bit HAM.

Most applications. Maybe not in raytracing and digitizing, but that's a MAYBE
since I've seen a few HAM8 pictures .. strange that I can see the faulty
colours .. no Amiga fanatic seems to be able to do it ...

No sport games on Amiga??? As far as I know Amiga has the best football
(or maybe I should say soccer, so that you Americans won't get confused)
games: KickOff 2, Sensible Soccer, GOAL! (aka KickOff 3)!

In many cases there is still room for improvement. I.e. the compiler we
use for SGI with best optimization on for R4000 still produces code about
twice as slow as a careful hand assembly. I do it from time to time if I
don't have anything better to do :-)

>Michael J. Farren farren@netcom.com

>> Last word : I've heard something about a DSP called 3210 that according to a friend of mine will beat the sh-t out of the 56001,if somebody got some info I would be very happy .

>Yes, it's the DSP that C= are supposedly putting on their Zorro III
>board. It should ship with headers for emulating a modem, speech
>recognition, realtime audio effects...

>Martin &

Yep , I have already heard about that and I also know that Apple has that DSP in some Macs but what I ment was that how fast is the 3210 ,is it as flexible as
56001 . And I would like some cycles of usual instructions (if that is possible) i.e. the DSP 56001 (the one in Falcon) can under one instruction-cycle do :
multiply two register ,add the result (or subtract) to an 56-bit accumulator ,round the result and move six bytes. The 56001 also support hardware loops.

Please no speculations like: "3210 can do zillions of billions of instructions /sec". I wan't facts.

Thanks in advance .

No, but using the cache hides the Falcons memory problems. Real-life programs
_are_ larger than the cache. The benchmarks are tweaked to show 030 advantages
anyway, but again, this has less impact on real-life programs than with these
artifical tests.

No, the 020 has a 256 byte instruction cache. It is still a bit inferior to the 030 instruction cache as the 020 can't fetch an instruction from the cache while moving data on the external bus (i.e. no hardware architecture).

DSP3210 Overview
----------------

The DSP3210 is a full 32-bit floating point DSP implemented in .9 micron CMOS.
It provides many advantages over fixed point DSPs such as the Motorola 56000.
Some of the main features of the DSP3210 include:

* 32-bit floating point arithmetic.
* 32-bit addressing.
* Large (8k) on-chip, zero wait-state memory.
* Single cycle instructions (for up to 33 Mflops).
* Share bus with Motorola or Intel style CPU.
* Serial I/O with DMA transfer conters for up to 25 Mbits/second transfer:
Serial data transfers occur without processor intervention.
Cycles are stolen when necessary.
DMA control for serial in and serial out.
* Barrel Shifter for bit manipulation in graphics or data encryption.
* Both mu-law and A-law encoding.
* Bit I/O general purpose 8-bit I/O port for control of external hardware.
* Programmable 32-bit timer for interval timing, rate generation, event counting or waveform generation.
* Fully vectored interrupt structure with hardware context save:
Allows very fast interrupt processing, up to 2 million/second.
* Low power CMOS design.

No special programming is required on the DSP3210 to implement floating point algorithms, or to process signals with a much larger dynamic range (in excess of 1500 dB as opposed to < 300 dB for fixed point). The DSP3210 is also designed to share a host memory bus with either a Motorola or Intel style CPU. This greatly reduces system cost by removing the requirement for expensive fast local memory for the DSP. This also removes any practical restrictions on program or data size. A large on-chip cache (8k) combined with software that intelligently utilizes the cache allows the DSP3210 to execute complex signal processing algorithms without expensive local memory. All instructions execute

in a single cycle (four clock periods> 80 ns for a 50 MHz part or 60 ns for a 66 MHz part) and includes all floating point normalization (which is performed automatically). A single instruction may have two floating point operations: a floating point multiplication and a floating point addition. The DSP3210 also supports up to four memory accesses in a single instruction cycle (quad-word transfer). The DSP3210 architecture features seven functional units:

* Control Arithmetic Unit (CAU)
* Data Arithmetic Unit (DAU)
* On-chip memory (RAM0, RAM1, Boot ROM)
* Bus Interface
* Serial I/O (SIO)
* DMA Controller (DMAC)
* Timer/Status Control (TSC)

The Control Arithmetic Unit
---

The CAU is responsible for address calculation, branching control and all 16 and 32-bit integer logic and arithmetic operations. It is a RISC core consisting of a 32-bit Arithmetic Logic Unit (ALU), a 32-bit Program Counter (PC), 22 32-bit general purpose registers (r0-r22) and a 32-bit barrel shifter. This core executes instructions at up to 16.7 million instructions per second. There are special register considerations in the CAU:

r0 hardwired to 0 (always)
r1-r14 DA instruction memory reference (X,Y,Z) pointer registers
r15-r19 DA instruction memory reference (X,Y,Z) increment registers
r20 used by error exception facility to store old pc
r21 stack pointer (sp)
r22 pointer to the exception vector table (evtp)

The CAU provides the following branching and control instructions:

if (COND) goto {N,rB,rB+N} Conditional branch based on flags
if (rM-->=0) goto {N,rB,rB+N} Conditional branch using loop counter
goto {N,rB,rB+N,M,rB+M} Unconditional branch
nop No operation
call {N,rB,rB+N,M}(rM) Call subroutine
return {rM} Return from subroutine
do K,{L,rM} Do next K+1 instruction(s) L+1 or (rM+1)
times. K=0,1,2...127; L=rM=0,1,2...2047
dolock K,{L,rM} Signals interlocked bus transfer
doblock {L,rM} Signals quad-word transfers
ireturn Return from interrupt
sftrst Soft-reset; changes error level to base
level; encoded as spc=(byte)r0
waiti Wait for interrupt; encoded as spc=(long)r0

where: rB = pc, r0-r22
rM = r1-r22
N = 16-bit unsigned integer

M = 24-bit unsigned integer
COND = one of the DSP3210 condition codes (refer to DSP3210 manual)

The Data Arithmetic Unit
---

The DAU consists of a 32-bit floating point multiplier, a 40-bit floating point adder, four 40-bit floating point accumulators (a0-a3), a clip test register (ctr), and a control register (dauc). The multiplier and adder operate in parallel to perform up to 16.7 million computations per second (12.5 million for a 50 MHz part) of the form (a=b+c*d), also known as a multiply-accumulate. The DAU contains a four stage pipeline which is visible to the application programmer. The DAU supports the following floating point formats:

Single precision (32-bit) in both DSP32 and IEEE format
Extended single precision (40-bit) (uses 8 mantissa guard bits)

Single instruction data type conversions are done in the DAU hardware:

DSP32 and IEEE 32-bit floating point
16/32-bit integer
8-bit unsigned
mu-law and A-law

The DAU has a number of special instructions to greatly simplify data type conversions and other common operations:

[Z=] aN = ic(Y) Input conversion mu-law, A-law, 8-bit linear to float.
[Z=] aN = oc(Y) Output conversion float to mu-law, A-law, 8-bit linear.
[Z=] aN = float16(Y) 16-bit integer to float.
[Z=] aN = float32(Y) 32-bit integer to float.
[Z=] aN = int16(Y) Float to 16-bit integer (round or truncate, dauc[4]).
[Z=] aN = int32(Y) Float to 32-bit integer (round or truncate, dauc[4]).
[Z=] aN = round(Y) Round to nearest, float(40) to float(32).
[Z=] aN = ifalt(Y) Condidional assignment/memory write.
[Z=] aN = ifaeq(Y) Conditional assignment/memory write.
[Z=] aN = ifagt(Y) Conditional assignment/memory write.
[Z=] aN = dsp(Y) IEEE to DSP format conversion.
[Z=] aN = ieee(Y) DSP to IEEE format conversion.
[Z=] aN = seed(Y) 32-bit to 32-bit reciprocal seed.

Where [Z=] indicates that condition codes may be set. Note that Y may not be a0-a3 for the dsp() special function.

Addressing Modes
---

DSP3210 assembler language exhibits a syntax very similar to 'C'. The notation conventions are as follows: a0-a3 are the accumulators (DAU), and r0-r22 are the CAU registers. Instructions take the following appearance:

r2 = (long)r1 ; CAU register direct: store the contents of r1 in r2
r1 = (long)*r1 ; store value pointed to by r1 in r2

```
r1 = (long)r1 + 1 ; increment r1 by 1
*r2++ = (long)r1 ; postmodify increment r2 after storing r1 there (in *r2)
r3 = (long)r1 + r2 ; add two numbers in r1, r2: store result in r3
r3 = (long)*r1++r2 ; post modify increment r1 by r2: store the result in r3
a2 = a2 + *r2 * a3 ; use that pipeline!
```

The following table lists the various addressing modes supported by the DSP3210:

| Instruction Type<br>Addressing Mode | CA Data Move Group (CAU Reg) | CA Data Move Group (I/O Reg) | CA Arithmetic/ Logic Group | DA M/A & Special Func |
|---|---|---|---|---|
| Short Immediate | Yes | | | |
| 24-bit Immediate | Yes | | | |
| Memory Indirect | Yes | | | |
| CAU Register Direct | Yes | Yes | Yes | |
| IO Register Direct | Yes | | | |
| DAU Register Direct | Yes | Yes | | |
| Register Indirect | Yes | Yes | Yes | |
| Register Indirect with Postmodification | Yes | Yes | Yes | |

## Latency Issues

The most difficult aspect of programming the DSP3210 is being aware of latency in the instruction pipeline. There are four cases in the DAU when the pipeline affects latency. The cases are:

1. DA Memory Writes. When a DA instruction specifies a write to memory, the value written is not available to be read from that location until four instructions later (a three instruction latency). For example:

```
*r3 = a0 = a0 ; instruction 1
*r3 = a3 = a3 ; instruction 2
. ; instruction 3
. ; instruction 4
a1 = *r3 ; instruction 5
```

The value read in instruction 5 is the value written in instruction 1, not instruction 2. Instructions 3 and 4 are latent instructions for instruction 1 and instructions 3, 4 and 5 are latent for instruction 2.

2. Accumulator as Multiplier Input. When an accumulator is used as an input to the multiplier, its value is established no sooner than three instructions prior to the multiply instruction (a two instruction latency). Note that this also applies to an accumulator using the X field of an instruction of the form:

```
[Z=] aN = [-]Y {+,-}X
```

For example:

```
a0 = a0 + *r1**r2 ; instruction 1
a0 = a0 + a1 ; instruction 2
. ; instruction 3
a2 = a0 * a0 ; instruction 4
a1 = a2 + a0 ; instruction 5
```

The value of a0 used in instruction 4 is calculated in instruction 1. The value of a0 used in instruction 5 is calculated in instruction 4 since there is no latency effect on accumulators used as inputs to the adder.

3. Branching. When a CA Control Group instruction of the form if()goto, call, return, goto is executed, the instruction immediately following is also executed before the branch occurs. This is commonly referred to as a delayed branch. The ireturn instruction is different, and execution of the base-level program resumes in the following instruction cycle. For example:

```
if(eq) goto over ; instruction 1
r1 = 3 ; instruction 2
. ; instruction 3
```

Instruction 2 is executed even if the condition is true and the branch is taken. If this is undesirable, a nop can be placed after the branch instruction, or if possible, the instructions can be rearranged. Because of this latency, a complex situation arises if successive branch instructions are coded in the following manner:

```
goto A ; instruction 1
goto B ; instruction 2

A:
.
B:
.
C:
.
```

The order of execution is instruction 1, instruction 2, A, B. If the instruction at A is not a goto, execution continues from B. If the instruction at A is goto C, the order of execution is instruction 1, instruction 2, A, B, C, and execution continues from C. Successive branch instructions are useful in some applicationss.

4. Conditional Branching on DAU Conditions. A DAU conditional branch or conditional arithmetic/logic instruction is established by the last DA instruction that affects DAU flags no sooner than four instructions prior to the test (a three instruction latency):

```
a0 = a0 + a1 ; instruction 1
a2 = a0 * a2 ; instruction 2
. ; instruction 3
. ; instruction 4
```

```
if(agt) goto next ; instruction 5
. ; instruction 6 (latent instruction)
```

The condition tested in instruction 5 is established by instruction 1, not instruction 2. Because of this latency effect, use the zero-latency ifalt(), ifagt() and ifaeq() functions where possible (see DA Special Instructions). The DA condition tested by these conditional accumulator loads is established by the last DA instruction that affected the DAU flags.

#1: The Falcon isn't dead. It's still being produced and still selling.
#2: I haven't heard of a shortage... enlighten me and give me sources.
#3: There's nothing that can touch the Falcon for MIDI in its price range.

I am not going to argue that the Falcon is the best general purpose computer
in its price range because i think that is very subjective (because we use
the word "general").

I will argue that for $1300, if you can live without a detachable keyboard
and internal drive bays for SCSI drives and some other minor creature
comforts, i don't see anything (as a musician) that can touch it for power
and still offer solid software.

Remember, that "dinky" 16mhz 030 machine runs Cubase Audio as well as an
'040 Mac.

>
>
>The Mac doom? Shows how out of touch you are...How do I polute this group when

Other than the fact that you are wrong (I've purchased eight role playing
games for my Amiga, for example), many people like action/arcade games more
than other types.

: MultiTOS sounds nice, my only complaint is that I can't find software
: locally for the Atari anymore. It seems somewhat pointless to have a
: multitasking envirionment with virtually no software to multitask :)

I think you have very succinctly summed up the situation with the
Falcon/ST with the above statement. You practically have to be
a private investigator to find Atari software so why even consider
buying their hardware?

Hell, Atari claims to have $35 million in cash and they are using
it ALL (per Bob Brodie's comments) to hype their game machine,
the Jaguar. That doesn't bode well for the pidgeons plunking
down their hard earned cash for new Atari boxes...

This True Color argument is getting old. I'm not going to go in a long speech on "What is True Color", but for those who are curious, I recommend in looking Vol 1 of the Xlib Programming Manual by O'Reilly. Read the beginning part on the chapter dealing with color. Since X has to deal with every possible type of display, this is a good source.

EB> faster.

Tell me WHY we should turn off the Falcon's caches, and add FASTRAM to the
A1200, before we do benchmarks?

Benchmarks has been run on the BASE configurations, the Falcon was WAY faster
than the A1200. Final.

EB> You made money Typing/Programming/Exploring/Learning? Programming sure,
EB> typing maybe... You made money learning? Exploring?

Programming. So What? You said none of the above would raise money, well ofcoz programming can raise money! Why argue over that?

EB> I haven't seen anything being blasted away... Sega hasn't gone bust...
EB> Maybe that's because nobody's even seen the Jag? I'd say you should pick
EB> your words with more care.

Why should I? Since when became the talk of a machine fully developed and ready for sale, not just out in the shops yet, forbidden here?

There's no Amiga CD32s in Sweden either as far as the local stores here can tell. (And no SegaCDs either!)

EB> One programmer doth not a platform make. This is a good point, however.

Ofcourse, I never said I would make a platform though ..

EB> What capabilities? What are you talking about?

Look below.

EB> But the Falcon can? Is this the "capabilities" you're referring to above?

EB> > SB> either. The DSP is fast at some things, but unfortunately bitmap
EB> > SB> scaling/warping isn't one of them.
EB> >
EB> > There's a demo out called "Speeder" which does EXACTLY this.
EB>
EB> In that case, the 1200 can do it too. A DSP is not a hardware scaling/
EB> rotation engine. And what was your point about demos above?

PLEEZE .. can't you accept the fact that the DSP can do some SERIOUS fast graphics work ... Do you know what's the real graphics engine in the SNES? The DSP!!! ...

The above mentioned demo uses the DSP to rotate/scale bitmapped graphics over more than half the screen

Hard facts, the A1200 CAN'T DO IT!

EB> Ooo, scare me some more... I've seen a Falcon, OK machine, nothing
EB> spectacular, sure as HELL didn't make me regret buying a 1200.

What did you see? (Cool demos, fast crunching, games, music)

EB> Somehow I doubt that. How would YOU know, anyway? Doesn't seem like you
EB> have much of a clue about anything...

"A DSP is not a hardware scaling/rotation engine." .... Please tell that to
Nintendo, they've succesfully used one in their SNES for quite a long time
doing just this.

I suppose this means YOU know EVERYTHING better than ANYONE.

But that's something different from saying that C= is dead. How about
ATARI? Atari is on the very verge on brankruptcy too. Even less money
that C= right now ( I think that C= is like 3 times ATARI right now).
True, the Jaguar looks nice, but on the other hand the CD-32 is already
selling in europe and has a lot of software support around it.

The Jaguar, as cool as it is, with no software jumps nowhere.

The 1200 costs 299GBP, the Falcon costs 999GBP. OK, you get a HD & 2 extra Mb but for the price difference, the Falcon damned well ought to be faster!

|> +-------------- Official RATSoft/ST and Climax SoftWare Support Site +

What is RATSoft? I used to use this name for PD I did on the 8bit Atari many years ago - circa '84.

I need to keep re-arranging my HDs (65Mb+380Mb+48Mb) Because I'm so pushed for room and everytime I buy something new it's a squeeze. If you want some software so badly, try getting it mail order.

Currently I'm mainly using Superbase 2, Lattice C, Ghostscript, DevPac, TruePaint, Wordwriter, 1St WordPlus, That's Write, Timeworks DTP, Cixcomm and mounds of PD and utilities as well as hardware like BlowUp030. When I changed from MSTe to falcon, the only thing that would no longer run is VIP Professional.

flight sims:

FA18 inteceptor
F19 stealth bomber
F29 retaliator
F16 Combat pilot ( I think it was called this )
Falcon
Falcon mission disks
Flight of the Intruder
Their finest hour
Battle of Britain ( I think it was called this)
Flight Sim. II
Birds of Prey ( fly 40 aircraft in this one )
Fighter Bomber
F117 A ( comming soon)
Gunship
Gunship 2000

You want more flight sims ?????

RPG/adventure

captive
Knightmare
Dungeon Master
Chaos Strikes Back

Eye of the beholder
Eye of the beholder II
Dungeon master II ( comming soon )
Abandoned places
Abandoned places
Dungeons of avalon
laser squad
lords of chaos
Hunter
Mercenary
Mercenary: second city
Damacles
loom
Zak McKraken
Indy III
Indy + atlantis
Monkey Island
Monkey Island II
Maniac Mansion
All those infocom + level 9 adventures
legend of kryanda
Enchantra
Lure of the temptress

+ a whole lot more besides

Wargames

Battle Isle
Battle Isle '93
Dueteros
( Im not into these sort of games but my friend has a few )

Sports

Cal.games
The sports pack
Kick off
Kick off 2
Extra time
Kick off data Disk
Sensible soccer
Sensible soccer '93
John maddens football
Tip off
Wayne Gretzkys ( sorry about spelling) hockey
Goal
Striker

Come on there are plenty of the sort of games you said arnt on the Amiga

What?!? Are you serious?!? The Mandlebrot demo shows that yes, you can use the DSP to get something done fast. That's about it. You can't use the DSP for desktop publishing, compiling your programs, or even raytracing (unless someone goes and translates thousands of lines of C into millions of lines of 56k assembler).

> >Who uses DOS?
>

Funny, I use a disk, and I don't have DOS on my system at work. I know better; I use OS/2. I don't have DOS on my system at home, either; it's running TOS.

Sure, TOS has disk-access calls, but it's certainly not running DOS (be it MS-DOS, PC-DOS, DR-DOS or whatever).

> It always takes some time for the software to catch up with new

> was predicted for the Non-Standard Hardware and Software.

Does that mean if I wait long enough, a nice, easy to use ray tracer will appear? Or POV-Ray will be translated into DSP assembler?

> Here we are years later, and most people don't even know what CP/M
> stands for. And we're going through the same development cycle
> again.

Unfortunately, there is no easy way to develop for the Falcon and get any speed out of the machine. The DSP has to be programmed in assembler, and most developers use C and/or C++.

> The Winter 1992 issue of the International TOS Software Catalog
> ($12.00 from your local Atari dealer, or direct from Atari) is
> an inch-thick compendium of ST/Falcon software. Outside of the
> USA, it's about 2.5 cm thick. :-)

I'll bet you that 99.9% of that "Falcon" software is
"Falcon-compatible", not "Falcon-specific". I can think of, hmm, let's
see... GEM-View can use the DSP to load JPEGs real fast; can't think of
any other useful programs (ie, not demos) that actually take advantage
of the Falcon's DSP. And looking at pictures is only handy for so long...

> Good software takes time. And Atari, having been stung by
> "Vapor" announcements in the past, doesn't announce things until
> they're done. We could speculate on '040s or '602s, but it would
> only be speculation.

At least six months before the 'official' Falcon030 announcement, we had
detailed spec sheets (and accompanying flame wars) floating around on
c.s.a.st; it took another six months for it to actually appear.

Now, if a Falcon040 spec sheet appeared today, it'd be Sept.94 before
they actually appeared for sale. Wow, that sure is something to look
forward to.

Atari has failed completely as a computer company; it's obvious that
their attention is on the Jaguar now. The ~50 million they had in
reserve for pushing the Falcon (which is what they told us when the
'official' release aired on GEnie) is now ~30 million, and to be used
for pushing the Jaguar. At least the Jaguar push might actually happen.

> Lessee ... the '486 @ 66 Mhz system ran the benchmark in 6 seconds,
> the Falcon ran it in 4 seconds. Do you really consider these systems
> to be consoles? If you do, you must desire something so advanced
> that it's not available on the consumer market, not just a mere....

No I don't. My point was that Atari seems to be only able to
build/market one machine at a time, instead of say, two (the Falcon and
Jaguar).

I can compile code on my ST that you couldn't compile on a '486/66
_at_all_; does that make it a better machine? Certainly not. There
isn't anything else the Falcon can do faster than a '486 of any speed,
except (possibly) load JPEG images and play MPEG animation (though if
you're using a real OS, '486s can do some wickedly good multimedia
stuff).

> I had 10K of "C" source code that compiled to about 5K on the Atari ST,
> but ballooned up to 19K on an MS-DOS machine. Sure, features add space,
> but the inefficiency of the clones adds unnecessary space.

Don't use DOS. All the code I compile on my ST is the same size
compiled for OS/2. Actually, the C++ code I compile on my ST is about
70k larger than the same code compiled on my '386 at work.

> As an evolutionary development, yeah. And when I get my Falcon, I'll
> be running Multitos.

Your Falcon will be running at the speed of an ST then; MultiTOS seems
to cut the speed of the machine in half (at least that's how it worked
on my ST... don't expect the fabled DSP to help you multitask).

> When I see speed decreases, it's usually when comparing my machine
> at home with my machine at work. It's pretty much a standing joke
> around here that I can be seen tapping my MS-DOS box on the side,
> saying "C'mon, c'mon, I've got an Atari at home faster than you are."

I guess you don't do anything that requires real computing horsepower;
even when I'm behaving, and only writing documentation or online help,
the 386 is running rings around my ST for churning out the desired
result. Word for DOS is certainly faster than PageStream on my ST.

> According to the Atari Annual Report, Atari considers itself to be in
> both the video game and computer markets. They put a lot of work into
> the Falcon, now they're putting a lot of work into the Jaguar (and
> using it with the Lynx, as well!).

And pretty much abandoning all the work they've put into the Falcon...
and the Falcon040.

>

You're missing the entire point. No one would run a Falcon with the cache OFF. If the cache can "hide" the performance bottleneck of a 16-bit memory interface, then why should it be considered a "crippled" architecture?

The real test of an architecture is how well it performs in a real environment. Not in artificial benchmarks designed to show it at its worst (or best).

Cache are designed to make a slower memory system perform like a faster memory system but at a lower cost. I think it's silly to try to judge an architecture by trying to "remove" the benefits of some of it's features (like a cache).

For example, let's suppose we are trying to design two computer systems.

1) Computer A uses a 66Mhz cpu with no cache. But we use very fast (and expensive) memory to keep up with the cpu.

2) Computer B uses a 66Mhz cpu with a 128K cache. The cache has a very high hit rate. This allows us to use much slower (and cheaper) memory to give basically the same performance on many real applications as Computer A.

The main point to note is that Computer A is going to be much more expensive than Computer B. But Computer B offers approximately the same performance. Which is the better computer? From a consumer's standpoint, Computer B is better.

Are you going to say that Computer B is "crippled"? And that we should only compare Computer A and Computer B by first turning off the cache? But the cache is one of the key architectural features of Computer B! Turning it off doesn't make sense to me.

In the same way, turning off the Falcon's cache to compare it with another computer doesn't make sense. The cache is a key part of its architecture.

Nope. The Jaguar's performance is currently at absolute zero. Call me when
I can buy one. The CD32, on the other hand, is OUT. I coould get one TODAY.

I suppose the cost of the engine may be a factor. In the U.S., though, lots of people like the rumbling sound of the high-cylinder engines. May next car may well be an 8-cylinder Z28. They finally gave that car a style that I don't hate. The only way to go from there is to the 10-cylinder Viper. B^)

>artifical tests.

Using the data cache might give the Falcon an advantage over the A1200, and I agree that the benchmarks should be written so that the Falcon has to look outside the data cache so that we can see how its 'real life' memory access fares (it is easy enough to disable the data cache anyway, and then run the benchmark). I _don't_ think that using the instruction cache 'favours' the Falcon (any more than it should) over the A1200 - since most 68000 instructions are of word (16 bit) length anyway, I wouldn't expect the Falcon to be crippled by its bus for instruction fetches for the majority of instructions. Turn the 030 and 020 instruction caches off before running the benchmarks if you really want to check out the worst case 100 percent cache miss scenario.

How else were the benchmarks tailored to show 030 advantages? (No flame - I'm just interested.)

My guess is that he included the space taken by the language disc, MTOS, and SpeedoGDOS in his estimate only, since the other programs can be considered applications and not operating system programs. ...And I'll bet he guessed higher rather than lower, just so the Atari would look even better on closer examination.

>multiply two register ,add the result (or subtract) to an 56-bit accumulator ,round the result and move six bytes. The 56001 also support hardware loops.

Well, I dont have solid facts as you may want. But, to give you an example. FOUR years ago at Mac World Motorolla gave away thousands of manuals for the 56001. I have about 14 different 56001 manuals and applications notes.

The AT&T chip is much newer and a fair amount more powerful.

But, even so, the 56001 has a pretty solid base and was a good choice. It is relatively easy to develop for because of the time it has had to mature. The AT&T DSP does not have as many solid development packages.

But, yes, the AT&T is deffinately more powerful. Maybe someone else can give you some numeric facts.

>with PCs resulting in unprofitability.

Hi!

I think that's exactly the point, the price. In .de (and I've heard we've
cheap prices in comparison to other countries) a A 1200 is 700.- DM. With
a HD, you've to pay 500.- DM more, makes 1200.- DM or 750 $.
With monitor you're pretty close the price of a 386/40 with monitor.
So what? The amiga is simply too expensive. Half the price would be OK.

adios, Kajetan

We haven't moved to *.advocacy because it's not available to BobR
(if I remember right....)

In article <90237@cup.portal.com> Bob_BobR_Retelle@cup.portal.com writes:
>A minimum installation of OS/2 requires 20 Megabytes of disk storage.

We aren't discussing minimum installations. We're discussing
complete installations. (That's like the difference between a merely
"decent" '486 and a '486 that is able to give Falcon-like performance,
a discussion that's already been discussed over in *.advocacy :-)

>MultiTOS takes a LOT less space because MultiTOS *does* a LOT less.

Since I haven't used MultiTOS yet, I can't reply to this comment.

>Windows does true pre-emptive multitasking... that dealer should read
>a few magazine articles.

My dealer _also_ sells MS-DOS machines, and invests the time to
stay knowledgable on the technical details of both systems.

>ALL computers require a disk operating system. TOS includes it in ROM,
>the PC loads it from disk. If you're using a disk, you're using a disk
>operating system, true, but on a PC it's not necessarially MS-DOS. (You
>have a choice).

True, there is a standard operating system that ships with *every*
Atari. It's also true that you can get alternate operating systems
(OS-9 springs to mind) that will run on the Atari. I see discussions
of alternate file systems on other threads in this and other Atari
groups, so I can assume there are a few more....

>Atari has been "rebuilding" its dealer network for the past seven years.

Persistant, aren't they?

>It's worse today than it's ever been.

At the San Diego Computer Fair this last weekend, Atari had a booth
showing the Falcon to an estimated crowd of 20,000+ attendees. They
had a musician in the booth composing an upbeat melody by randomly
selecting passersby (kids age 12 and under seemed the bravest and most-
willing) to add tracks to it. (I think they were using SMPTEtrack as
the software package to drive the system, but I'm not certain.)

The demo was so impressive and so well received that the area around the
booth was jammed by people who were standing & watching/listening, and the

Falcon flyers vanished into eager hands. The local dealer had to bring
more flyers from his shop to replenish their supply. This sort of
interest was not evident at the Microsoft booth or at the OS/2 booth.

Based on this, Atari is:
A) Actively marketing to the end user,
B) Actively supporting their existing dealers, and
C) Being actively supported by their existing dealers.

With this kind of support, there will be more dealers in the future.

>The Jaguar was brought up because Atari has virtually abandoned the Falcon
>already, putting (according to Bob Brodie, just to satisfy Warwick's
>curiosity) all its resources ($35 million, down from the $50 million
>they said they had to launch the Falcon) toward launching the Jaguar.

It that were true, they wouldn't have been at the San Diego Computer
Fair, actively demonstrating only the Falcon!

>
>

Well, I haven't tried the SNES Mortal Kombat yet but I did rent a
Genesis and Mortal Kombat over the weekend (I got it early too). I was
generally disappointed with it but I might have been expecting too much
as I am an avid Mortal Kombat fan from the arcades. Here's a few things
wrong with the Genesis one:

It just does not capture the feel/timing of the stand-up. This
could partly be because of the Genesis controller that I was stuck
with, see below.

Very jerky animation (must be missing several frames of animation)

Hard to control (this one could be the fault of the standard
Genesis crappy controller, it seemed that I could hardly ever get the
straight directions up, down, left, right when I needed them; I would
end up with a diagonal instead) Although I thought they did a good job
with remapping the 5 buttons of the arcade to the 4 buttons of the
Genesis. I have yet to get Kano's fatality to work (I got all the others)

Almost none of the samples are there other than Scorpion's
'Get over here'. Everything else gets a generic grunt or something
substituted in its place. I really miss Lui Kang's thrust-kick scream
and Raiden's torpedo scream.

The images used for the fighters facing left are just mirror
images of the fighters facing right instead of actually seeing the
other side of the fighter (this trick is not used in any of the
stand-up fighting games).

After each game I have to wait for several minutes to get to
play again if I don't continue (I think it is kinda wrong of them to
let you press start to get past the 'Midway' logo yet you have to sit
through 'Sega', 'Arena', and 'Probe' for a long time, did I forget one?)

This is not necessarily a bad thing but I was getting Reptile
appearances out the ying-yang and have never seen him at the arcade
(still haven't fought him yet on either Genesis or arcade)

In closing I will just say that this is no substitute for the
arcade version. I will rent a SNES and its version soon to see how
it compares to the Genesis and arcade, until then ....

>to buy the programs.

You should really try out ClarisWorks 2.0, its cheap (about $165 Australian, or, with Aus $1 ~ US $0.66, about $110 US), not a RAM hog, does pretty much of everything, and extremely well integrated - as opposed to MS Works' different program for WP, Spreadsheet, Paint, Draw, Comms etc since you have access to all of your tools, all of the time, so allowing it to be a rudimentary DTP (you can link, move, edit .. etc the text boxes in the regylar DTP way).

In addition, ClarisWorks 2 gives you simple presentation facilities, brilliant gradients with adjustable shape, sources, and number or transition colours, and a small smattering of painting effects like smoothing etc.

If $110 US is too expensive and you really don't need the database, spreadsheet, graphing, and comms bits of ClarisWorks, you can try out
(a) Publish It Easy 3.0 ~ US $109 - a full featured DTP program,
(b) Colour It! 2.0 ~ US $129 (I think this is the low end paint program which has that nifty "transmogrify" tool which warps colours a la Calvin and Hobbes :) ) - either this or some of the simmilarly priced paint programs like Colour Mac Cheese etc...,
(c) Fractal Design's Sketcher ~ US $94 - only grey scale but the effects which it can accomplish is amazing (The 32bit colour version of this is expensive at US $235 .. ouch), and
(d) SuperPaint 3.0 for about US $99.

So, you might not like the Mac but don't misrepresent the many good software houses which publish software for it - doing so for a reasonable cost to the user. Indeed, many of the "high-end" packages such as Canvas 3.0.6 etc. can be had for about US $260 .. expensive, but for what it does, I think it is a resonable cost.

In addition, many people have the preception that Mac games are unimpressive - however, a quick look at the Pathways Into Darkness demo that is hanging about the popular ftp archives reveal a Wolf 3D type game which plays well and whose screen can be resized to the maximum size of your screen (typically 640x480) seemingly without simply increasing the size of the graphic's pixels.

Of course not, but the point is that the benchmark should not fit in the data
cache if you wish to measure memory speed. Most real-world data does not fit
too well in the cache. Code often fits somewhat better.

To those thinking Mac games are unimpressive, you are generally correct. I just loaded Pathways Into Darkness on my Quadra to check out its full-screen capability. This is one of the few excellent Mac games, but not at full-screen on a 20" monitor. Pixels are huge, and the speed is unbearably slow on a 33MHz 040. Overall, though, it is a excellent game. Spectre Supreme is another good one (like the clone version), but it just uses vector graphics.

>Yes, try it! But please remember that there are still some difficulties:
>- The Falcon definitly HAS a DSP - what evidence do you get from a benchmark
> which does not use this chip?

You have an estimate on what the machine can do for conventional programs.
Not all programs can use a DSP and not all programs that can use a DSP will
use it.

>- Don't test only memory-movements! The perfomance of a system does not only
> depend on this (i would estimate that moves cost less than 20% of the time).

No, moves are quite essential. Not the MOVE instruction itself, but mainly
opcode fetches depend on memory performance.

>- I suggest to test the SAME assembler code on both platforms to get a
> comparison of the basic system (without custom chips). This code must be
> extensive - to be honest: i don't want to write it :)

Not necessarily the same. For a 32bit memory system you want your data
32bit aligned. This has no importance on a 16bit memory system, so when
using nonaligned data you can bias the results.

>- How likely is it, that the Instruction cache is not used? I expect that the
> benchmark will not try to bypass this cache :)

It depends on what you want to show with the benchmark. If you want to
_measure_ details you probably have to disable the caches for some tests.
If you want to show general performance then you should use the caches
to whatever the system thinks is 'standard'.

The benchmarks were biased towards 030, display modes were chosen that make
the Falcon look good and much information about the setup was missing.
Real-world applications will be a complete different thing, so will be
neutral benchmarks.

The cache can hide the performance bottleneck. But how good is that ?
For the benchmarks the cache made _any_ memory bottleneck invisible
(and that was the purpose of the 'benchmark').

>The real test of an architecture is how well it performs in a real
>environment. Not in artificial benchmarks designed to show it at its
>worst (or best).

Exactly :)

>Cache are designed to make a slower memory system perform like a
>faster memory system but at a lower cost. I think it's silly to try

A _256 byte_ cache has not a very high hit rate except for these benchmarks.

>to be crippled by its bus for instruction fetches for the majority of
>instructions.

Well, that would be true IF the 020 or 030 would fetch instructions
individually. But in reality they always do 32bit prefetches. (On a 32bit
bus the 030 would even burst in 4 32bit words in a row very quickly).

> How else were the benchmarks tailored to show 030 advantages? (No flame -
>I'm just interested.)

One easy thing is the fact that the memory write appeared just before a
long internal operation (MUL). On a 030 this hides the write completely.

>56001 . And I would like some cycles of usual instructions (if that is possible) i.e. the DSP 56001 (the one in Falcon) can under one instruction-cycle do :
>multiply two register ,add the result (or subtract) to an 56-bit accumulator ,round the result and move six bytes. The 56001 also support hardware loops.

A have no 3210 handbook handy, but it is about same speed as 56001 regarding
_operations_. The 56001 can do a little more in some instructions, but the
3210 has more general purpose registers as a compenstation. The major
difference is that the 3210 uses floating point arithmetic (compared to
56001 which does fixed point) and that it has a 32bit _address space_.
The 56001 has some problems to handle a large dataset, you either have
to feed it all the time keeping a host CPU busy or need some smart memory
banking logic. The 3210 can use megabytes of memory quite easily.

> * 32-bit floating point arithmetic.

compared to the 24/48/56 bit fixed point arithmetic. This has advantages
but also disadvantages (especially when 32bit precision isn't enough).

> * 32-bit addressing.

Definitely a pro.

> * Large (8k) on-chip, zero wait-state memory.

Also a pro. Is that 8k _bytes_ or 8k _bits_ ?

> * Single cycle instructions (for up to 33 Mflops).

Peak for 56001 is 33 'Mfixps'.

> * Share bus with Motorola or Intel style CPU.

Same for 56001 although the 56001 usually acts as a peripheral with memory
on a dedicated bus.

> * Serial I/O with DMA transfer conters for up to 25 Mbits/second transfer:
> Serial data transfers occur without processor intervention.
> Cycles are stolen when necessary.
> DMA control for serial in and serial out.

Pro for applications that need a fast serial port. If you use the port for
a codec (that doesn't need 25MBits/s) the difference to 56001 is minor.

> * Barrel Shifter for bit manipulation in graphics or data encryption.

Pro.

> * Both mu-law and A-law encoding.

Like the 56001.

> * Bit I/O general purpose 8-bit I/O port for control of external hardware.

Like the 56001. The 56001 has 3 ports: a host interface, a synchronous serial
interface and a serial communications interface. All of these can be used as
about 20 general purpose I/O ports for control of external hardware.

> * Programmable 32-bit timer for interval timing, rate generation, event
> counting or waveform generation.

56001 has a rate generator that can also be used for timing, it's smaller
though (16bit ?).

> * Fully vectored interrupt structure with hardware context save:
> Allows very fast interrupt processing, up to 2 million/second.

56001 also has very fast interrupts.

> * Low power CMOS design.

Not so low power :) 56001 uses about 350mW. There's a low power version
though (even available for 40MHz but more expensive).

>No special programming is required on the DSP3210 to implement floating point
>algorithms, or to process signals with a much larger dynamic range (in excess
>of 1500 dB as opposed to < 300 dB for fixed point).

Read above. Special programming might be needed for signals which need a
larger precision.

The SNES version is perfect in terms of timing. I've played it repeatedly,
and the only flaw in it as I see it is that it is a little too easy for me
to get through the whole game with Scorpion. Also I hate the control pad, but
they do have more buttons than Sega so they are more faithful to the original'
feel.

The lack of excessive violence is compensated because they keep the feel of
the coin-op.

>
> Very jerky animation (must be missing several frames of animation)

The SNES version is solid in this area.. .I can tell the difference in that
the arcade has more detail, especially in the background but the colors and
speed feel about right.

>

I don't know all the death moves for the characters so I didn't egt a chance to do but 2. :) but it seemed remarkably complete on the SNES version.

> Almost none of the samples are there other than Scorpion's
>'Get over here'. Everything else gets a generic grunt or something
>substituted in its place. I really miss Lui Kang's thrust-kick scream
>and Raiden's torpedo scream.
>

All of that is in the SNES version.

Anyways, to make this point relevant to the Jaguar thread... I think after playing this SNES game, the hottest genre seems to be fighting games. I sure hope Atari is paying attention to this trend because as much as I'm going to love finally being able to play Tempest at home, I really feel that they will need something akin to SF2 or Mortal Kombat to sell machines.

First Question is: USA today had two articles on MK and in both it said that both versions (SNES & GENESIS) were made by Aklaim. Whussup?

Excerpts from netnews.rec.games.video.misc: 13-Sep-93 Re: Mortal Kombat for SNES .. by Glen Sescila@natinst.com

glens@natinst.com (Glen Sescila) wrote:

> The images used for the fighters facing left are just mirror
> images of the fighters facing right instead of actually seeing the
> other side of the fighter (this trick is not used in any of the
> stand-up fighting games).
>

I seem to remember that Kano in the arcade has his metal side showing _ALWAYS_ (I haven't checked but I am pretty damn sure) As far as I can tell most games does this mirror flip (why make two pictures when one will suffice, save the memory for more important stuff) Just to carry this further think of DPs in SF2, on the left side it is the right fist in the air and vice versa on the right. Don't gripe if it ain't worth griping about.

>benchmarks.

On the contrary. I think the point is to see which is the best
trade-off: "32 bit bus, no cache, 14.4MHz" or "16 bit bus, cache, 16MHz".
A1200 has no cache, Falcon has 16-bit bus.

I expect that a benchmark could be written which makes either more impressive.
A real test would be to do something real and compile the code with GNU C on
both machines.

Q: Does the 68EC030 have the high-speed shifting circuitry?

>multitasking tends to gronk caches as the `locality of reference`
>thing goes out of the window...

What a crock. If the timeslice is, say, 200ms, then you've got 3 million
clock cycles that can take advantage of locality of reference*.

Are these things so hard for people to work out for themselves?

Does Gavan think Unix boxes don't have or need caches?

* Locality of Reference is the tendency in real-world programs for the
processing point (both program counter and data addresses referenced)
to jitter in small areas for mouch of the time. For example, loops
in code, records in data. Caching is designed to take advantage of
this tendency by remembering recently used locations and (in spare time)
by loading in more from an area of memory than the code is actually
asking for. RISC processors take additional use of locality of reference
by using this latter approach of sucking in extra data to the point where
it even starts executing instructions that are AFTER a branch, in
anticipation that half the time that branch won't be taken!

>Real-life programs are larger than the cache.

But real-life loops are not. Do you think they put caches in chips
for no reason? Are you aware that many chips have over 1/3 of the
silicon devoted to cache?

Numerous experiments have been done with real-world code and found
that a cache seriously enhances performance. There are a lot of other
things you can do with 1/3 of your silicon (eg. shifters, fast multipliers,
etc.)

Hands up A1200 owners with GCC 2.x.x installed on there system, then we can
do some real-world measurements.

Um, yes. There IS also the small point that the 1200 uses an '020, while
the Falcon uses an '030.

> I expect that a benchmark could be written which makes either more impressive.

Hmm... That depends on how good the GCC port is, though... What you want
is a machine code benchmark that doesn't fit in the cache (no "serious"
benchmarks do, I think %), but leave the caches on. Running high-speed
loops in the cache doesn't prove anything about anything.

Does that mean Atari OS has memory protection? I haven't heard of memory
protection for the Atari OS though I've been out of touch with the Atari
market for awhile already.

If the Atari OS doesn't have memory protection so what are you hyping
about?

I come to read about the Jaguar and I get caught up in this ... 8-).

Rickard, I've seen it asked once before, so how many Falcons have they sold in Sweden? Considering the whole world isn't Sweden, I don't see where the numbers are wrong. Also, if DMZ is a C= Magazine, don't know what you mean by paper, then don't you also know that lead time of magazines are anywhere from 1-3 months? In plain language, that means that the stuff you read in the magazines, are news from 1-3 months ago.

As far as I can gather, this comes from the Bandito in Amazing Computing, that for CD's the technology has been licensed to Philips from Kodak, you know the maker of the CD-I, I don't see C= going to them for licensing anytime soon. The one good thing is that CD32 will have MPEG for it. And Kodak Photo CD will be available for the Jaguar though no mention of MPEG.

The TT comes pretty close to the mark. And tests have shown that the
TT is approximately twice as fast. Since the processor is twice as fast,
you could very fairly guess that when running at half the speed it would
operate at near to the speed of the Falcon... yet the Falcon has 16 bit
bus while the TT has a 32 bit bus.

(For those who doubt this last statement, the details as I understand
them are that there is a 32bit but from RAM to CPU in all except the
first machines which had a 16bit bus, and a 16MHz CPU [ie. the same
as the Falcon !!], the TT has a 64bit path from RAM to video, and there
is no measurable difference in performance in any mode [my experience])

Post them then. The only way to argue that a benchmark is biased is to
give an example of what you consider is "neutral". In fact, try to find
some examples which show the A1200 in a brighter light - that's fine too.

Can you do it?

Okay, then I guess I'll have to write this for the THIRD time:

According benchmarks, the 16Mhz Falcon030 is 50% the speed of a 32Mhz TT030
(which has 32 bit FASTRAM).

Does that sound crippled to you?

Nope, not to me either.

Wrong. Grab some real-world code and COUNT the number of loops that are
less than 256 bytes. You will be amazed. Do you think Motorola just put
the 512 bytes of cache in the 68030 so it would run well on artificial
benchmarks? Motorola doesn't think the computer industry is full of fools
(unlike Intel, with their 8048638808286088 chunk of chip which has more
escape characters than a TV prison).

Sorry for interrupting your interesting discussion but as far as I know the A1200 got cache to ,if not why would C= put an option in the special start-up menu to disable CPU-caches (from what I heard this is a cache something like the cache in MegaSTE).

And again ,when testing moving longwords on Falcon it seemed to me that 32bit isn't crippled ,but the videl and all that DMA-shit on the bus is occupying the bus so much that moving bitmaps on Falcon isn't very fast(I estimated it to six busscycles). Also I've heard that you can get FastRam for the Falcon where the CPU can play for itself (something like the FastRam you can buy for the A1200).

RH> Ah, and try doing 64-bit wide sprites on the 65536 colors on the
RH> Falcon... ah,
RH> you can't.

If you by sprites mean those hardware sprites the Amiga got you are quite correct but if you just mean having a moving objekt on screen you are wrong.

Since the best part(and some times also the worst) with the 16bit mode is by moving a word to the screen you set the colour of one pixels(fast pixels routine).
This opens some interesting programming possibilities , I am of course talking of selfgenerating code , you analyse a BOB and if there is pixel which is non-black you do a move.w (a0)+,(a1)+ (where a0 is BOB ,a1 is screen) if there is two pixel beside each other which are none black you do a move.l (a0)+,(a1)+ ,if there is black pixels you jump over them (lea 2*n(a1),a1 where n is number of black pixels in a row)(of course you can think of situations where it better to use indexed addressing mode instead).

Of course you can add some more advanced sg code (this is the simplest example). When you done your analysing and created the code you one fast plot code for this BOB (if the `030 would run at it`s full speed ,it would be a very plot code).

====================== Maarten Raange / d3marten@dtek.chalmers.se

}
}
} Does that mean Atari OS has memory protection? I haven't heard of memory
} protection for the Atari OS though I've been out of touch with the Atari
} market for awhile already.
}
} If the Atari OS doesn't have memory protection so what are you hyping
} about?
}

An off-the-top-of-my-head list of what the Atari OS is/has:

o Multi-user
o Multi-tasking (adaptive, pre-emptive)
o Multi-threaded
o Shared text between executing programs
o Memory protection used if 030 or above detected
o Device drivers loadable at boot time
o Filesystems loadable at boot time

What is currently under way:

o TCP/ip in the kernel
o Full shared library capability
o Multi-threaded disk interface

Loadable fs mean that any partition can have any type of fs supported
on it, and all you have to do is write a few callable functions
which the OS will use whenever it has to use that type of partition.
In this manner, I have a 50Mb minix fs on one of my HD's.

One major PLUS is that the OS has its source code freely available
(you can download it form many bbs's or ftp sites). It's still
copyright Atari/Eric Smith, but there is a large number of people
who add features to it, the code goes back to Eric, and he releases
a new official version. This in addition to whatever Eric does at
Atari. There is also a large number of people working on the C
compiler libraries for the OS; in fact the traffic was so big they
split the maintainers for the OS and the libs - it was too much for
one person to manage :-)))

Another (IMHO - people may disagree :-) major plus point is the
unix-like nature of the OS - apart from the TCP socket stuff, it
is almost always possible to take source from comp.sources.unix and
compile it straight off: especially if you intend to use the minix
filesystem. Using the TOSfs is slightly more problematical for things
like shells (unix uses '/\ as a dir separator, TOSfs uses '\'). But
in general, all the unix calls are there and software compiles
with no hassle. Eg: flops20.c has a -DAMIGA compile option, but
I just compiled it with -DUNIX. (flops20 is a Mflops benchmark). This
will become far more useful when the sockets are implemented. Then
X windows/ client-server stuff ought to be almost trivial to compile.

Simon.

I was not among those 'screaming' for benchmarks, although I was interested
in seeing results. If you felt that the benchmarks that were posted were
representative of 'real' performance then you are only deluding yourself.
The benchmarks would certainly show the Falcon in a somewhat better light
than they should. I'm saying this, and I'm a Falcon owner - figure out for
yourself if the benchmarks were really 'good enough'. Benchmark results are
always questionable anyway, but these benchmarks are definitely naive and
I would not place any wager on the accuracy of the results obtained.

Hmmm... Ok, I'll let you get away with this statement this time.

>|> bench2:
[...]
> 3. You ran *ALL* the benchmarks in at 60Hz, in which the bus contention
> on the A1200 starts to make a stronger mark. If you had Fast RAm
> the results would be damn different.

But I won't let you get away with it this time.

What resolution do _you_ suggest he runs the tests in? He has used the same resolutions on both machines - if the A1200 has bad bus contention in these modes and the Falcon doesn't then _TOUGH COOKIES_. The A1200 bus contention is obviously crippling its performance, and this is a factor that must be taken into account, as it would cripple its performance in real operation as well. You want benchmarks that show the 'crippling' effect of the Falcon's 16 bit bus in a bad light, but you want the same benchmarks to be run in a video mode that conceals the A1200's bus contention? That's _very_ hypocritical I'm afraid.

The A1200's bus contention is as much a factor in its performance as the Falcon's 16 bit memory bus.

I recall people in this group making a big thing about the Falcon's bus contention in its bigger video modes when it first appeared. Are you saying that the A1200's bus contention is _worse_ than the Falcon's in any given video mode unless you add Fast RAM?

Now before you start going on about how you can add x Megs of Fast RAM to the A1200 for the same price as a Falcon, the original poster stated very clearly, more than once, that he was using a base A1200 with no Fast RAM since he did not have access to an upgraded one. By all means run some benchmarks on an upgraded A1200 against a Falcon and tell us the results, just don't criticise the original poster for using what was available to him. I do concede that the Fast RAM will improve the A1200's performance, but let's just have a range of results that show how the machines fare given various different hardware configurations.

Before we proceed we must get straight in our minds what we are comparing? Are we comparing a base Falcon (1 Meg no HD) with a base A1200? Are we allowing the A1200 to be upgraded with FastRAM to make up the price differential?

[...]
>|> bench3:
> 3. Same comment of running @60Hz with no fast ram.

Tough. I agree that the benchmarks themselves are not representative, but this comment about the choice of video modes is just daft. If the video modes chosen are the same, then that aspect (at least) of the benchmark is fair. Period.

>|> I'm waiting for the figures of an Amiga 1200 with FastRAM...

See, I told you he stated clearly the conditions he was using. I would assume that he did not disable the 68EC020's instruction cache unless he states otherwise. :-)

- Andy.

# 1810. Re: Mortal Kombat for SNES vs. Jaguar

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-14 15:29:05 UTC
From: glens@natinst.com
Message-ID: <274o01$mnc@falcon.natinst.com>
Source record: 21438

Well, I have 2 more beefs with the Genesis version of Mortal Kombat
in addition to the original list that I posted yesterday. Eventually I will
rent a SNES and its version to see how it compares. I definately would not
buy the Genesis version.

1) Slowdown on the Pit. Could it be the clouds causing the strain
on the Genesis? And on a game such as MK slowdown could be a severe problem
(especially for those combo masters)

2) Not only are ALL the left-facing images just mirror images of the
right-facing ones (gives new meaning to the term 'Mirror Match') but
Sub-Zero uses Scorpions images!!! This is pitiful. (Sub-Zero's arm should
not be cocked up like Scorpions)

Oh well, in any event I will be Reptile hunting tonight. I am still
getting Reptile appearances in abundance. And for those of you sending me
the Arcade Mode (fatality) code, please stop. I already have it and it
does not help justify any of the problems I mention.

P.S. Can somebody tell me how to do Kano's fatality? (on the Genesis, I
know how it's done at the arcade and it don't work on the Genesis).

The genesis version can be placed in "violent" mode with a certain set
of keypad movements (like Street Fighter foir the SNES can be put in
enhanced mode). The SNES version cut out the violence all together.
(Well they are still fighting of course . . .)

I will give you that ClarisWorks provides a consistent interface across its
implementations but....the functionality provided is extremely basic. The
comm bits just are totally unimpressive. The wordprocessing is blown away
by even Write Now. The spreadsheet would be more appropriate as a PD
offering, the drawing is very basic and so forth. And, I don't know what
you consider a RAM hog but when my sister cranks up Claris Works on
her nine Meg IIsi system, that's about all she can do. This somewhat
condemns the method by which Mac OS memory management is used
but still......

Uh, rent a clue? The Genesis version works with the 6-button Sega pad
if you have it plugged in.

I don't know about all of you out there but isn't this thread running a
little bare (excuse the pun). Who cares if the Amiga's faster or slower,
i don't as i don't intend to buy the Falcon and i'm sure many other feel
the same. Now if it gives you a nice macho feeling that your computer is
faster than his than fine. As for me i buy (as again i'm sure others do)
based on a number of things mainly involved around will it do the job(s) i
want it to ?

Nuff said

>programming can raise money! Why argue over that?

The point was, could you make money programming the Falcon? For a decent
pay? At least $10/hour, so you can make a living on it. I'd be surprised if
you could. You definitely can on the Amiga and SEGA. You would not believe
how much you can make programming games for these machines; it's almost
ridiculous.

>There's no Amiga CD32s in Sweden either as far as the local stores here can
>tell. (And no SegaCDs either!)

So I guess your store managers don't know much down there in Hassleholm.
I have a CD32, and I could buy myself a SegaCD at Stor&Liten here in
Linkoping, if I wanted/needed one. So both machines are definitely available.

>EB> > SB> either. The DSP is fast at some things, but unfortunately bitmap
>EB> > SB> scaling/warping isn't one of them.
>EB> >
>EB> > There's a demo out called "Speeder" which does EXACTLY this.

>EB> In that case, the 1200 can do it too. A DSP is not a hardware scaling/
>EB> rotation engine. And what was your point about demos above?

>PLEEZE .. can't you accept the fact that the DSP can do some SERIOUS fast
>graphics work ...

I'm sure the DSP can do things fast, but the real problem is that before
the DSP can actually do it's thing, you have to transfer the data to the
DSP's local memory. That takes a lot of time. Moreover, there's nothing
a DSP can do for bitmap scaling that a 68030 could not. There's no
time-consuming math involved in scaling/rotating a bitmap, just data
shuffling.

>Do you know what's the real graphics engine in the SNES? The
>DSP!!! ...

That's a pretty interesting statement; The SNES doesn't even have a DSP.

>EB> Somehow I doubt that. How would YOU know, anyway? Doesn't seem like you
>EB> have much of a clue about anything...

>"A DSP is not a hardware scaling/rotation engine." .... Please tell that to
>Nintendo, they've succesfully used one in their SNES for quite a long time
>doing just this.

You're utterly clueless. The SNES doesn't even *have* a DSP in the base
unit.

>I suppose this means YOU know EVERYTHING better than ANYONE.

Probably not, but he seem to know a few things you don't.

Of course a timeslice is more 5..20 milliseconds and a multitasking system
usually makes more use of interrupts. With a small 256 Byte cache this
becomes noticable.

And now back to reality. We were talking about 68020 and 68030 which have
_small_ caches. Nothing even close to 1/3 of your silicon.

If you do 'numerous experiments' on these CPUs you will see that you either
have loops larger than the cache or loops that extensively hit memory for
data with say a Mandelbrot set calculation being a rare exception.

Interestingly, in the GEnie conference with Bob Brodie reprinted in
the last AEO, he says that Atari decided that pc sales were in a slump,
so there was no sense spending money promoting the Falcon. However,
twice in the last month, I've seen NewsBytes articles that claim the
opposite, that pc sales are booming, and the last article I saw said the
prediction was for 7% growth in already high sales in the coming year.

^^^^^^^^^^

Opps, sorry about that ... maybe I should have just said that it looks
very good at 640x480 resolution and left out the hyperbole.

Now for my nitpick :) :
From your opening sentence, are you saying that the majority of Mac
games are unimpressive? If so, then can't I also say that the majority
of games on most computers are "unimpressive"? I am quite certain that
the ratio of "impressive" to "unimpressive" games on the Mac isn't any
smaller than the ratio which you find for the PC or the Amiga.

What I think you should have said was that the total number of Mac games
is small when compared to other platforms - thus resulting in a smaller
"total" number of "impressive" games.

By the way, have you had a look at the demos of "StarTrek: 25th
Anniversary" and "F/18"?

TC

>use the DSP to get something done fast. That's about it. You can't use
>the DSP for desktop publishing, compiling your programs, or even
>raytracing (unless someone goes and translates thousands of lines of C
>into millions of lines of 56k assembler).

Yes you _can_ use the DSP for raytracing, and no you _don't_ have to convert the entire of something like POVray into 56k assembler to do it. The actual raytracing loop is an iterative procedure, the type of thing at which the DSP is very fast. You can leave the main code for something like POVray intact and running on the 68030, this includes the parsing etc. Even if you only wrote a DSP maths library to replace the maths functions you could still increase the speed of the raytracing massively. You don't have to use the DSP to do everything, you know - that's the whole idea. The DSP does not run entire programs, it's a parallel processor that can be used to offload tasks from the 68030.

It is very true that the DSP is not always useful. This should not be disputed by anyone. It is not a general purpose 'do anything' processor like the 68030.

Now I'm not volunteering to write the DSP floating point maths emulation required for something like POVray since I am not yet conversant with the 56k assembly language, but I know at least one person who would be capable of doing it.

I also understand that one of the products currently under development for the Falcon is a rendering/raytracing package using the DSP. I can probably find the article on it if you'd like...?

>Does that mean if I wait long enough, a nice, easy to use ray tracer
>will appear? Or POV-Ray will be translated into DSP assembler?

Very possibly. And maybe not that far in the future either...

Time will tell.

>Unfortunately, there is no easy way to develop for the Falcon and get
>any speed out of the machine. The DSP has to be programmed in
>assembler, and most developers use C and/or C++.

The DSP must be programmed in assembler, this is true, but there is nothing stopping people from developing libraries of DSP routines and making them available for use from within C or C++ programs. Think about it. C and C++ code generators for the PC will need to be rethought to take advantage of the Pentium when it appears - you always need some time to develop tools for any new addition...

>Your Falcon will be running at the speed of an ST then; MultiTOS seems
>to cut the speed of the machine in half (at least that's how it worked
>on my ST... don't expect the fabled DSP to help you multitask).

In half? Well it's not that bad. It does decrease the speed of the system noticeably. And OS/2 doesn't? And Windows doesn't?

All multitasking OSs incur some overhead somewhere...

>> When I see speed decreases, it's usually when comparing my machine
>> at home with my machine at work. It's pretty much a standing joke
>> around here that I can be seen tapping my MS-DOS box on the side,
>> saying "C'mon, c'mon, I've got an Atari at home faster than you are."
>I guess you don't do anything that requires real computing horsepower;
>even when I'm behaving, and only writing documentation or online help,
>the 386 is running rings around my ST for churning out the desired
>result. Word for DOS is certainly faster than PageStream on my ST.

It's very, very sad when programs running on a 386 at, what? 25 MHz? 33 MHz? do not cream programs running on an ST on a 68000 at 8 MHZ.

It's the old PC story. Throw more and more processor power at every problem.

Problem Solution
Word processor not fast enough? Buy a Pentium.
Graphic package too slow? Buy a Pentium.
Any other problem? You need a Pentium.

User Question
"Why is my software too slow?"

Dealer Answer.
"You're only using a 33MHz 486? That's yesterday's technology, friend. What you need is to upgrade your motherboard to a 66MHz system. Here, just sign this blank cheque and we'll laugh all the way to the...errrm... I mean we'll see to the upgrade of your old, horrible, slow PC to a brand spanking new one. See you next month for your next upgrade. Bye."

In the PC market, all the emphasis is on the customer spending more and more money to get a faster and faster computer so he can run his software at something approaching a reasonable rate of speed. The sad thing is that people put up with this sh*t. This is the only home computer market where this is the case. In markets such as the ST's or the Amiga's, software manufacturers compete to get their software running as fast as possible in order to attract customers. Speed problems are actually addressed by the programmers, whereas in the PC market they just

seem to say "Oh, this is a bit slow. Well, just make the minimum system requirement a 486DX2 66, and then it'll be passable."

Please note : I am not saying that _all_ programmers for the PC think this way by any means. What I am saying is that I can't see why it should be necessary to have such massive processing horsepower to run a word processor. Why?

The way the computer market is heading I can forsee a day when I might be _forced_ to purchase an IBM PC contemptible in order to get any software at all. This will certainly NEVER be done by choice, only by necessity.

I pray that this _never_ happens.

"If it looks like sh*t, smells like sh*t and performs like sh*t then it's probably sh*t..."

...Or an IBM PC compatible.

>And pretty much abandoning all the work they've put into the Falcon...
>and the Falcon040.

Time will tell. I personally can't see many inherent design problems in creating an 040 Falcon. It would definitely get rid of that 16 bit bus though, 'cause the 040 can't work with a 16 bit data bus to the best of my knowledge (unlike the 030 and 020)...

Cheers

- Andy.

In the UK they are 299GBP and it comes with AFAIK 2 games. Neither looked remotely good. Maybe later stuff will use the hardware better.

well, instead of your defeated oppient just fading away or blinking out,
you get to rip his/her spine out. Thats really all thats too it.

Idea for the Jaguar: Make a descent space fighter game based upon the
BattleStar Galatica universe. (or maybe just rip it off like wing commander
series did and call it Star Radiers 3)

>"total" number of "impressive" games.

It is only the result that is significant. There are less impressive
games for the Mac than for the Amiga. My officemate, who also owns a
Mac, is very much impressed by such games as "Solarian II" and "Space
Madness". He would be blown away by "Hybris" on the Amiga.

This is really no big loss for the Mac. It is already used quite a
bit in the business world, and it has much better applications than
the Amiga.

>By the way, have you had a look at the demos of "StarTrek: 25th

The '030 in the Falcon do have burst transfers enabled!
Which means that it "even burst in 8 16bit words in a row very quickly".
I think that this is the real reason that the Falcon is so much faster than
an A1200.

The 56001 as fitted in the Falcon uses DMA. Because of realative large fifo-
queues in the DMA controler, the DMA don't hurt the CPU much.
A random access scheme as used by the 3210 will cust much (speed) because it
have to acquire the bus, do _the_ bustransfer, and release the bus again.

# 1837. Atari and Time-Warner

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-15 20:57:40 UTC
From: khaley@nova.gmi.edu
Message-ID: <khaley.748126660@nova>
Source record: 21472

There was a thread of postings about 2 weeks ago, with several questions concerning Time-Warner's link to Atari. For those newer Atari people who don't know much of early Atari history, below is a short recap (as much as my memory serves me):

Atari was founded by Nolan Bushnell in 1972 with the invention of PONG, the first computer video game. Shortly thereafter, Bushnell sold Atari to Warner Communications (before the Time Warner merge).

Warner Communications pushed Atari to develop the video game. After the PC came to market in 1978 (I believe), Atari inc. developed the 8bit Atari 400/800 computers. This line was extremely successful in the early personal computing market, finding its way to several schools (yes, schools!) in California, Michigan, and Illinois.

Meanwhile, the Atari coin-op and 2600 video game market boomed in the early 1980's. Atari became a huge money-maker for Warner, dominating the video game market and a potent force in the PC market. However, a slump around 1984 dragged down Atari and several computer companies went out of business (Timex/Sinclair, Osborne, Adam, etc). Warner Communications sold Atari to the Tramiels for $350 million (I think).

Under Tramiel, Atari developed the ST, which was released in 1986. In the beginning, it was an instant success, and was the major factor bringing Atari back to profitability. With the revival of the video game market, Atari developed the XE game system (I remember TV was bombarded with commercials regarding this system in 87), and in the late 80's, the portable Lynx. As Atari developed other systems (the TT, Portfolio, Falcon, and now the Jaguar), the prominence of IBM compatible computers edged out the Atari market. This is where Atari is today. Struggling to keep PC's on the market and create a popular game system.

I was a loyal Atari follower for many years, and knew a large number of Atari computer users in my area. It is my sincere wish that development for the Jaguar succeed, so I can see an Atari prominence that I so fondly remember in the early days of the computer/video game system.

People who like the duel games don't necessarily like Streets of
Rage type games... personally I think that game sucks, same with the
Turtle and Final Fight whatever... too lame. But the one-on-one fighting
games have a depth technique of which many people are not aware. I did not
like them at all until I experienced Street Fighter II back in 1990.

|> >the ratio of "impressive" to "unimpressive" games on the Mac isn't any
|> >smaller than the ratio which you find for the PC or the Amiga.

I am quite sure the ratio is much smaller. I remember the very first
time I saw Shadow of the Beast I on the Amiga... I had to pick my Jaw
from the floor. I would like to see any Mac *attempting* to do the same.
Parallax scrolling with dual-playfields *and* stereo high-quality sound.

Most 'games' I have seen on the Mac so far are the 'educational' type.
'Very interesting'. I remember my Mac roommates in college: 'look, this
game is very cool' (Rogue). Or Chess, Or Shangai, etc. Yawn. NOT bad
games... but...

Now, I have to admit I have seen two games on the Mac that I have
to take my hats off to the programmers, considering the limitations
on the machine they were programming on (a Mac Plus or SE I think, and a
```

Mac and monochrome for that matter) the games are truly outstanding:

Dark Castle and Beyond Dark Castle. Very challenging and hilarious games.

|> >What I think you should have said was that the total number of Mac games
|> >is small when compared to other platforms - thus resulting in a smaller

And again, I strongly believe that the ratio of impressive games on
the Mac vs number of games is much smaller there than on the Amiga.

Can't beat custom hardware-> Amiga has sprites, dual-playfields, the
copper and all of that standard in the lowest denominator.

|> This is really no big loss for the Mac. It is already used quite a
|> bit in the business world, and it has much better applications than

How? Having a 16-bit datapath to memory defeats this Motorola capability.
Maybe you 'can enable' the '030, but that it works is another matter.

|> Which means that it "even burst in 8 16bit words in a row very quickly".

It is my understanding that this is *NOT SUPPORTED* by the 68030. You need
full 32-bit access for doing the burst.

|> I think that this is the real reason that the Falcon is so much faster than
|> an A1200.

That the Falcon is so much faster than the A1200 hasn't been proved yet.
If you belive in those benchmarks, I'll have a bridge to sell you.

Sorry, it can have burst transfers enabled as much as it wants with no
effect.

From the "Enhanced 32b-Bit Microprocessor User's Manual", Section 7.3.7,
Page 7-60 (in the 3rd edition).

"The MC68030 allows burst filling only from 32-bit ports that terminate bus
cycles with /STERM and respond to /CBREQ by asserting /CBACK..."

> this feature.

Unfortunately, STs don't have enough RAM or processor power to use
MultiTOS well (not really a complaint, they're obsolete machines
anyway).

Unfortunately, the Falcon030 doesn't support what whould be the _ideal_
RAM size for multitasking (and doing some more complex work with G++): 8
megs. That's how much RAM you want on a Windoze or OS/2 system, too.

Windows uses 'co-operative' multitasking, just like the ACCs can do on
an ST; Mac System 7 does the same thing. Truly pathetic when you have a
processor hogging task (like a ray-tracer).

>(...but it's to expencive, really...)

Tha A1200 *may* have better price/performance ratio but the I/O of the
whole Amiga range is frankly pathetic. The falcon outguns all the
Amigas on I/O. (eg scsi, midi, lan,A to D, D to A, centronics, modem, DSP,
4 joy sticks, cartridge etc)

To get falcon-like performance, install Windoze on a '386/33; the Falcon
is a SLOW machine no matter how you look at it (unless you've been using
an ST all your life, and nothing else).

> >Windows does true pre-emptive multitasking... that dealer should read
> >a few magazine articles.
>
> My dealer _also_ sells MS-DOS machines, and invests the time to
> stay knowledgable on the technical details of both systems.

If Windows did pre-emptive multitasking, single applications wouldn't be
able to hog the system so easily. Also, when you install Windows, it
doesn't multitask DOS programs _at_all_, you have to change the default
settings to get that to work.

> True, there is a standard operating system that ships with *every*
> Atari. It's also true that you can get alternate operating systems
> (OS-9 springs to mind) that will run on the Atari. I see discussions
> of alternate file systems on other threads in this and other Atari
> groups, so I can assume there are a few more....

The alternate filesystem thread has almost nothing to do with operating
systems; it's about MiNT (which isn't a complete OS, since it relies on
the underlying TOS to get its work done).

> >Atari has been "rebuilding" its dealer network for the past seven years.
>
> Persistant, aren't they?

More like 'stupid', IMHO. The number of dealers just keeps shrinking.
You really can't call music shops 'dealers', since probably 99% of them
have no clue about computers, they just know that the Atari machines
have MIDI ports already, and a few good software packages.

> Based on this, Atari is:
> A) Actively marketing to the end user,

Hahahahahaha....

> B) Actively supporting their existing dealers, and

Hahahahahaha... That one's even better; have you forgotten what's
happened to Canadian dealers ever since Atari Canada was 'right-sized'
out of existance?

> C) Being actively supported by their existing dealers.

Atari's _needs_ to be held up by its dealers or it would've died
completely in the past four years.

> With this kind of support, there will be more dealers in the future.

But still no hardware for them to sell, and no one to sell it to because
the Falcon is not competitive with _anything_ else on the market.

> >The Jaguar was brought up because Atari has virtually abandoned the Falcon

> It that were true, they wouldn't have been at the San Diego Computer
> Fair, actively demonstrating only the Falcon!

Yes it would, because they _can't_ demo the Jaguar yet, so the Falcon is
their only potential source of income right now. They certainly haven't
been demoing a more powerful Falcon anywhere, now have they?

You do realize that these are also Amiga games, though I don't know which
versions came first.

> And again, I strongly believe that the ratio of impressive games on
>the Mac vs number of games is much smaller there than on the Amiga.

Yes, most Mac users are impressed with the latest version of Solitaire. Until
I see Street Fighter 2 Turbo for the Mac, it is nothing more than a business
machine. B^)

> Can't beat custom hardware-> Amiga has sprites, dual-playfields, the
>copper and all of that standard in the lowest denominator.

Macs are going the way of the clones by throwing lots of hardware at every
task. Of course, the price of Macs are getting better every day; 040 systems
are close to $1000.

No. But its doing well in Europe which is where I live. I was
giving a European perspective.

> What is this mythical Amiga home market?

It`s about 1.5 million machines is the UK alone...

>The Mac doom? Shows how out of touch you are...How do I polute this group when
>I speak the truth..

By your own standards the Mac is doomed. Since when has apple
sold more macs than other companies have sold PCs? Show me some
systems where Macs are cheaper than the equivalent PC. Apple used to
get by on selling reltively few machines at a huge profit margin.
PC sales are cutting away at this margin - result: apple loses
profitability. And its getting worse all the time for the Mac.

>I speak the truth..

I notice you rarely answer points, normally you try and change the
subject if someone blasts one of your `truths` out of the water. If
you aren`t prepared to defend your verbal diarrorhea (sp?) then I`m
not going to keep arguing with you.

>Benchmarks has been run on the BASE configurations, the Falcon was WAY faster
>than the A1200. Final.

Look at the marks. The F030 *WASN`T* `WAY faster`.

Base Amiga = 300 UKP

Base Falcon = 600 UKP (for the 1 meg model)
= 900 UKP (for the 4/65 RT claims is base)

Amiga =1/2 to 1/3 cost of Falcon

I'm a little lost as to why one should cut off the Falcon's caches. I agree
the 1200 should have FastRAM thrown in just to see what this standard option
would do for performance.

>>Benchmarks has been run on the BASE configurations, the Falcon was WAY faster
>>than the A1200. Final.
>
>Look at the marks. The F030 *WASN`T* `WAY faster`.
>

I looked at it.. it certainly was faster than the A1200. The benchmarks
seemed to show that the 16-bit bus can be compensated for in some cases,
at least, by the onboard cache.

Now, of course, if we wanted to punish both machines, we should write a
large loop that exceeds the size of both machines' cache RAM and which
accesses longwords relative to some fixed address but at different offsets.
In fact, an excellent test of the system might be to play around with some
of the addressing modes with indirection and offset.

>Base Amiga = 300 UKP
>
>Base Falcon = 600 UKP (for the 1 meg model)
> = 900 UKP (for the 4/65 RT claims is base)
>
>Amiga =1/2 to 1/3 cost of Falcon
>

Also, Amiga with no HD and 2MB of no FastRAM. :)

The 900 ukp version of the Falcon has double the RAM and an 80MB IDE HD,
a 56001 DSP, SCSI-2 port, MIDI ports (standard), the usual serial and
parallel ports, two 9-pin joystick ports, two 15-pin jaguar compatible
joystick ports, and comes with AtariWorks, MultiTOS, and SpeedoGDOS.

Now, for some people, that's a lot of goodies, and might justify the price difference. For some, it won't.

Incidentally, I've noticed the only person doing benchmarks was an Atari Falcon user. Are the 1200 owners chicken? hehehehehee

P.S., has anyone tried benchmarking how fast these machines use their HDs? Just the IDE ones, that is. I'm curious to see what they can do. Also, it'd be nice to implement some kind of speed test for both machine's blitter chips.

Rickard, again: On - real - world- applications- the - caches- are-
shit- compared -to - their- effect- in - those-
benchmarks.

Maybe saying it slower you might be able to understand it.

|>
|> Look at the marks. The F030 *WASN`T* `WAY faster`.

Hell no. I am even starting to doub Rickard is a good programmer
at all. A good programmer will understand that those benchmark
give *tons* of bias since the fit in all the cache.

Ok, since no one else will pick up the gauntlet... I'll tell you that I've got a friend who has reserved one of the first batches of Jaguars and his is due "1st week of October". He's also got a 3DO on order from the same place.

I'm sure that I'll be over his house during that month for the fun. :)

So, the moment I see it... I'll get back to you. :) I really am looking forward to the 3DO as well because my favorite sports game, Madden Football, is coming out with the 3DO in the first batch of releases for it.

The DSP is a general-purpose coprocessor. Suggested uses include
low-cost fax/data modems, voice mail systems, and direct-to-disc
digital audio recorders (suggested by Atari in their Falcon brochure).
The fact that you're surmising it's also used in the Mandelbrot
demo shows how versatile it is.

>better; I use OS/2. I don't have DOS on my system at home, either; it's
>running TOS.

OS/2 (short for "Operating System/Two") is a Disc Operating System
(DOS).

>Sure, TOS has disk-access calls, but it's certainly not running DOS (be
>it MS-DOS, PC-DOS, DR-DOS or whatever).

TOS (short for "The Operating System) contains a Disc Operating
System (DOS) called GEMDOS. It is not MS-DOS, although it uses
MS-DOS file formats.

>Does that mean if I wait long enough, a nice, easy to use ray tracer
>will appear? Or POV-Ray will be translated into DSP assembler?

Are you asking for a prediction? Predictions are easy to make!
However, I don't know of anyone working on a ray tracer that makes
use of the Falcon's specific hardware. And anyone who is working
on such a project probably has a Non Disclosure Agreement keeping
their mouth shut and their fingers occupied.

C bindings for the DSP are being discussed in other threads, and
it probably won't be long until such support will be available in
high level languages like Basic.

>Unfortunately, there is no easy way to develop for the Falcon and get
>any speed out of the machine. The DSP has to be programmed in
>assembler, and most developers use C and/or C++.

(See previous paragraph)

>I'll bet you that 99.9% of that "Falcon" software is
>"Falcon-compatible", not "Falcon-specific". I can think of, hmm, let's
>see... GEM-View can use the DSP to load JPEGs real fast; can't think of
>any other useful programs (ie, not demos) that actually take advantage
>of the Falcon's DSP. And looking at pictures is only handy for so long...

Compatibility is important! Ask any user of the MS-DOS machines! :-)
Regarding the current dearth of Falcon-specific software, let me repeat:

>> Good software takes time.

>Atari has failed completely as a computer company; it's obvious that
>their attention is on the Jaguar now.

Most of their attention is on the Jaguar -- it has attracted an
amazing amount of interest (read: potential business and sales).
But just this last weekend, Atari was present with a booth at the
San Diego Computer Fair demonstrating Falcons to an estimated
20,000 attendees.

There were no Jaguars to be seen.

Nope, the facts don't support you here, because Atari is still
actively showing and selling the Falcon.

> The ~50 million they had in
>reserve for pushing the Falcon (which is what they told us when the
>'official' release aired on GEnie) is now ~30 million, and to be used
>for pushing the Jaguar. At least the Jaguar push might actually happen.

And when the Jaguar is a massive success (here's hopin'!), they'll
have a large marketing budget for the Falcon. And the Lynx. And
the TT. And whatever projects they've got under development now.

> My point was that Atari seems to be only able to
>build/market one machine at a time, instead of say, two (the Falcon and
>Jaguar).

With limited resources, they have to pick and choose carefully.
As they grow, they might just surprise you with new stuff and
support for the existing lines.

>I can compile code on my ST that you couldn't compile on a '486/66
>_at_all_; does that make it a better machine? Certainly not.

Sorry, I didn't mean to start a compiled-code shootout here. I was
attempting to show that the inefficient architecture of the MS-DOS
machines caused an expansion in executable code size when compared
to the source code, while the efficient TOS architecture caused
a reduction in code size.

>> I had 10K of "C" source code that compiled to about 5K on the Atari ST,
>> but ballooned up to 19K on an MS-DOS machine. Sure, features add space,
>> but the inefficiency of the clones adds unnecessary space.

> There
>isn't anything else the Falcon can do faster than a '486 of any speed,
>except (possibly) load JPEG images and play MPEG animation (though if
>you're using a real OS, '486s can do some wickedly good multimedia
>stuff).

"Atari vs The EXPENSIVE World Of DOS" it says in the subject line. It
takes a $2500.00 '486 @ 66 MHz to keep up with the capabilities of
the $1500.00 Falcon. I'd rather save the $1,000 and use it for
other things. Like a week-long vacation at Disneyland/Knott's Berry
Farm/Medieval Times.

> All the code I compile on my ST is the same size
>compiled for OS/2. Actually, the C++ code I compile on my ST is about
>70k larger than the same code compiled on my '386 at work.

Now it's beginning to sound like two programmers with differing coding
styles arguing over technique. I'm certainly not going to comment on
your claim or your coding style. If it works for you, do it!

>I guess you don't do anything that requires real computing horsepower;
>even when I'm behaving, and only writing documentation or online help,
>the 386 is running rings around my ST for churning out the desired
>result. Word for DOS is certainly faster than PageStream on my ST.

Comparing a word processor (Microsoft Word) to a desktop publisher
(PageStream) will certainly make the word processor look good in the
speed department! :-) Have you tried comparing software that runs
on both machines (Microsoft Write springs to mind)?

>And pretty much abandoning all the work they've put into the Falcon...
>and the Falcon040.

Nope -- see the report about the San Diego Computer Fair, noted
above.

## 1864. Does Commodore read any of this?

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-16 16:43:47 UTC
From: kruger@mhd1.moorhead.msus.edu
Message-ID: <1993Sep16.104347.5478@msus1.msus.edu>
Source record: 21389
Cross-posted to: comp.sys.amiga.advocacy,comp.sys.atari.advocacy

It has come to my understanding that C= has an internet connection.

My question is:
Does Commodore read any of these posts on here.

The answer:
probably not, but I would like to be proved wrong by
either a response from someone associated w/ the company
or a better attitude towards the US market (if I owned C=
and saw how many U.S. users I was screwing over due to
any desire to obtain recognition for the Amiga, I would
feel pretty damn terrible)

Then again, they probably don't post because they would be subjected
to major flamage from those who are sick of their marketing strategies.

BTW-- Someone told me that C= fired their sales staff and replaced them
with the staff from NewTek. Is this true, or is this just a rumor?

|> the 1200 should have FastRAM thrown in just to see what this standard option
|> would do for performance.

Because it shows how fast the Falcon access the memory. Flip, I agree
that chaches are a benefit to a CPU, but when you have those 'benchmarks'
that FIT ENTIRELY IN BOTH CACHES (almost), DO YOU THINK THIS IS THE
REAL LIFE SITUATION?

Ask me, I have a '030. How much I benefit from the caches? An
average of 12% In the test where the guy cutted off the cache, the
Falcon was 75% slower. Hey! If my machine with the '030 benefited
with a 75% improvement on real-applications, I would never like upgrading
to a '040! (which is not true).

|> >>Benchmarks has been run on the BASE configurations, the Falcon was WAY faster

|> at least, by the onboard cache.

The benchmark DIDN'T SHOW A DAMN THING! It all fits in both CACHES!
THIS IS NOT A REAL LIFE SITUATION.

AGAIN, I HAVE A '030 AND THE CACHES DO NOT GIVE 75% PERFORMANCE BOOST!

|>
|> Now, of course, if we wanted to punish both machines, we should write a

|> of the addressing modes with indirection and offset.

Good. Another thing you can do is do a code that is Greater than
256 bytes, jump to another area after the main part has been executed
to flush the icache (instruction cache) and see what happens. This is
a more real-life situation: some instructions get cached others not.

|>

|> >
|>
|> Also, Amiga with no HD and 2MB of no FastRAM. :)

It's not that much to add fast ram or hardisk. Here in the US
I can add for $600 a 68030 @ 50Mhz with 4 megs fast ram. That will
blow the Falcon out of the water performance wise, except where DSP
applications are concerned. And it's still way under the Falcon price.
Add the hardisk and is still cheaper than the Falcon.

|> The 900 ukp version of the Falcon has double the RAM and an 80MB IDE HD,

|>
|>
|>
|> Incidentally, I've noticed the only person doing benchmarks was an Atari
|> Falcon user. Are the 1200 owners chicken? hehehehehee

No. I am not. But as you see, I can't get hold of a Falcon. I'm
in the US where the Falcon is virtually non-existant.

|>
|>
|> P.S., has anyone tried benchmarking how fast these machines use their HDs?
|> Just the IDE ones, that is. I'm curious to see what they can do. Also,

|> chips.

Well, if we ever test blitters, let me remind of that doing some
graphic objects with the A1200 is easy with the HARDWARE sprites and
DUAL-PLAYFIELDS.

:
: If this post has been too difficult for anyone, I'm sorry. I tried to use
: small words for you all.

Was this some sort of joke that none of us got?

Pseudo-technical bullshit? Seems like your the one shovelling the bullshit
Atari feeds you. As for ignorance, if you think believing everything you
see is not ignorant, then I've got lots of Elvis Lives and UFO's stole my
cat stories for you.

In what way is the 68000 auxillary?

Running the game engine? Or do you think Atari have written an operating
system, compiler, libraries, binaries and cross development tools for the
Jaguar-risc chip?

Where's the 64 bit Jaguar-risc chip binaries live? In a 32 bit ROM chip?
If it does, then it's not going to be running at peak speed, executing
perhaps compressed binaries and at best, 32 bit code on a 64 bit cpu.

Or do you believe that it will copy the entire game engine from the 32 bit
ROM to the 64bit RAM? If it does copy to RAM, then it has to live with
the 1.5MB (or there abouts) of video graphics (which is 32bit of colour
at max resolution). Things are going to get tighter, even tighter when
you consider that RISC binary executables are anywhere from 20% to 500%
bigger than a comparable CISC program.

What about the developers? Are there lots of Jaguar-risc gurus, who know
how to program an unnamed processor which is not have a wide body of
documentation available? Other risc processors, like the ARM and MIPS
range have been available and documented. Or is one risc like another
one and more easily to get to grips with, than going from 680x0 to 80x86?

: -Adam

Now, if you can answer the questions posed above, then I'll believe you have "proved" that the Jaguar-risc-chip is the CPU and the 68000 is an auxilary chip. If not, then I guess my hypotheiss that the 68000 is the cpu is maintained (until the Jaguar is releasd, then we'll all know).

- Jim

If nobody buys it, it doesn't matter how impressive the hardware is. What
it boils down to is marketing, marketing and games.

>Since I don't work for this BIG company with 10000000 emplyees, I don't have
>to sell 30.000 copies .... Let's say I make only 50 SEK on each copy myself,
>and that it sells 1.000 copies .. that's 50.000 SEK .. while it may not be
>much for a big games company - I'm very satisifed with it.

If you put maybe a man-year into developing the game, you wouldn't
(shouldn't) be satisfied with that. It would be a waste of time. And
selling 1,000 copies of a game for a platform with only 20,000 units
sounds pretty darn optimistic if you ask me ;-) Why not make the same
game for, say, Amiga or PC and make fifty times as much?

>SB> If you had the choice of making $4000 on a Falcon game, and making
>SB> $100000
>SB> on the same game on the Amiga, which would you choose? (Somehow, I know
>SB> you're going to say Falcon ;-)

>Too bad the Amiga doesn't have the capabilities then.

It sure has money-making capability at least. Considering the swedish
development (three persons) team of Team17 has made more than two million
swedish kronor ($250000) in royalties on the last three games we have made
for the Amiga, and that's not counting additional income from console/PC
conversions.

This is getting old. I'm bored with this discussion, and since you
seem to have your mind made up about everything already, this is leading
nowhere. I will let you continue playing with your Falcon undisturbed,
and go back to doing something productive with my time, instead of
arguing with an infantile narrow-minded fool.

And we all know how much a MIPS rating is worth, don't we? Your 16-MIPS DSP
is not a general-purpose processor, so it is pretty meaningless to compare
it to the 68020, which is capable of much more than the DSP. The DSP is good
at performing mathematical operations on large arrays of data, but hardly
very good at performing more general-purpose operations.

That's a load of crap. You can get an A1200 with 40M HD for less than
5500SEK from any mail-order company. Considering that you in an earlier
post said that the Falcon 4/60(85?) cost half as much as an A4000/040,
which costs 23000SEK, we quickly arrive at a price of approximately
11000SEK for a Falcon 4/x. For the 5500SEK difference in price you
can get quite a lot of stuff for the A1200 before we arrive at the Falcon
price level.

>4 joy sticks, cartridge etc)

Maybe in terms of quantity in the stock machine. But most Amigas with HDs use SCSI, MIDI is a $70 adapter box, Ethernet/Arcnet is available (and better than the 'LAN' you find in the Falcon but also more expensive), A to D is called 'sound sampler' and exists for some years, D to A is built in (4 channels), centronics is standard (also bidirectional like the Falcon), modem is standard (and you can get various RS232 cards), DSP is not really an I/O device, 4 joysticks require a $10 adapter and cartridges exist in the form of PCMCIA on some Amigas and in the form of expansion boards on others.

Pathetic ? I beg to differ.

Regards,

>

Well, with a "real-life" situation we'd be using compiled C code that
would probably call the operating system if moving screen memory on
an Atari (hence, using the Blitter) or *could* use a small loop to
copy the memory over (hence, fit in the cache).

I'm not saying the cache is a real replacement for not giving the
CPU full 32-bit access to RAM, but consider this... most loops that
are that large won't be a series of move instructions, will they?
If you want to move 32,000 bytes, you could do:

```
move.w #31999,d0
.loop
move.b (a0)+,(a1)+
dbra d0,.loop
```

This will definitely fit in the cache. It'll also take advantage
of the special dbra 3-inst. loop capability in all 68010 or better
CPUs.

Now, I could break a cache if I do this:

```
REPT 32000
move.b (a0)+,(a1)+
ENDR
```

And this would probably be at LEAST as fast as the other set of instructions on a 68000... in fact it would easily roast the dbra method because there is no need for loop control. But how often are we going to see this method implemented?

So let's say many loops are implmented with a hybrid approach, where perhaps we jump into a "tower" of move instructions relative to the PC when we determine the number of bytes/words/longs, etc.. to move. If all of the code fits in the cache, it's going to look great on a 68030.

Also, let's think about what the code that creates relatively large uncacheable loops is doing.. is that code doing a lot of move ops? Will there be a lot of addresses to decode or will it be using the registers? Most compilers will optimize something that difficult to utilize the registers, and we're not using an 8086 but a Motorola, so we've got enough registers, even with compiler overhead, to generate some decent code.

How about this.. since we all can't agree on the original benchmarks, why not do a GCC compile on both platforms with 4MB of RAM on an IDE drive and see which one finishes compiling the same code first?

(this'll test "real world" use...right?)

```
>
> The benchmark DIDN'T SHOW A DAMN THING! It all fits in both CACHES!

>
```

Well, let's find a "real life" situation. Geez.. calm down. :)

```
> AGAIN, I HAVE A '030 AND THE CACHES DO NOT GIVE 75% PERFORMANCE BOOST!
>
```

For all I know you may just have a bum '030 upgrade. :) Chill. :)

```

```

Isn't that what I said? Run a loop of code that exceeds the size of
the cache?

And for all this talk of caching... doesn't the A1200 have a cache
on the 68020? Isn't this cache essentially the same as the '030s?
Even without FastRAM it shouldn't be too much slower than the
Falcon.

>|> Also, Amiga with no HD and 2MB of no FastRAM. :)

>Add the hardisk and is still cheaper than the Falcon.
>

This I'd like to see. :) The cheapest I've seen A1200s is $430 with
2MB of FastRAM and no hard drive. RAM ain't cheap right now, so
I'm leery of saying you can jack up your RAM cheaper than what
comes standard on a Falcon (i.e., the price on the Falcon hasn't
changed a bit since RAM went up).

Whose 68030 board? I asked about the CSA Shotgun in your .signature
at Buried Treasure in Rockville, MD and you know what they told me?
They said that in their experience, CSA boards aren't exactly the
most reliable and that they stopped carrying them. So what works
for you might not be available or possible for everyone else,
especially if their dealer advises against it.

>|>

That's funny. I'm in the USA too, and I have no problem seeing Falcons.

>
> Well, if we ever test blitters, let me remind of that doing some
>graphic objects with the A1200 is easy with the HARDWARE sprites and
>DUAL-PLAYFIELDS.
>

Hardware Sprites: in "real life" great for... the mouse cursor and
maybe animated icons?

Dual playfields: useful for... what? large virtual desktops or
something of that ilk. How often do you see that in a C compiler?

I'm not saying it ain't useful, but part of what makes the machine
look good on paper may not be the right solution for someone whose

uses would never utilize it. Remember when a lot of people were saying "nice DSP in the Falcon but I'd never use it"?

>Yeah, but you could do THAT for the (16-bit) A500. I'm not impressed.

True. But that A500 wouldn't have 32-bit custom chips, each with 32
bit access to the "chipRAM" would it? It also would lack all of
the associated I/O ports and the DSP. It also would be running into
a 7.16mhz 16-bit bottleneck when it tried to go to "chipRAM" whereas
the Falcon's 33mhz 68030 board would go to a 16mhz 16-bit bottleneck.
Wow. That's real similar. :)

<the A500 would be 2X slower going to chipRAM than the Falcon just
based on clock speed alone!>

In fact, let's say the Falcon IS 15% slower than an A1200. How
much faster is an A1200 w/o FastRAM over an A500? Now, if you
jack up the A1200 to 33mhz 68030 and added some FastRAM I bet you
and all the whalers in your neck of the woods might be impressed. :)

<so chill..and don't be so biased... in fact, i might have an A1200
this Friday (tomorrow).. before i get my Falcon, even... if things
go right for me. :) it's all a matter of getting the right tool
for the right job, mon ami!>

Name some useful software for either platform... :)

<just kidding>

Well, that would be nice, but what would we run that both have?
WordPerfect 4.2? PageStream 2.x? Dr. T's KCS 1.8? What would we
benchmark? How fast they scroll a screen of text? How many
simultaneous MIDI events they can catch at a timing resolution of
368 ppq?

The best comparison (imho) that both could do would be to compile some
C code on both using the "widely available" GNU C. We should even
use the standard, built-in IDE drives so that we get a feel for
how useful both machines are out of the box....

(of course, the Amiga owner will probably need 2 more MB of RAM to
get the A1200 up to 4MB to run the compiler... )

In fact, after the code is compiled... we can further test both
by making the code that IS compiled a benchmark. :) Then we can
see who is making the better port of their compiler. :)

I agree with you that the options exist and are quite nice for the A1200,
but I think the important thing to the original poster is that all of
those items are included, standard, on a stock Falcon.

As for the DSP not being an I/O device... that depends... you could indeed
use it as a processor to handle "streams" of I/O and affect them. That's
what happens in voice recognition but also in more "down-to-earth" uses
like audio digitizing (and the industry buzzword, direct-to-disk recording).

No matter what you do you will not be able to equal the Falcons sound
system on your A1200.

>channels), centronics is standard (also bidirectional like the Falcon),
>modem is standard (and you can get various RS232 cards), DSP is not really
>an I/O device, 4 joysticks require a $10 adapter and cartridges exist in the

There is a seperate DSP port on MY Falcon....:)And mine should be
the same as everyone elses....(ie STANDARD!)
Can be used as a D2D interface; DAT/CD digital out to DSP in.

: Yes. It's easy. Add the 33mhz 68030 board which has up to 128MB FastRAM
: available and away you go.

In other words, yes, as long as you move the CPU off the motherboard, and
make that ram local.

Which isn't at all like adding fast ram to a 1200, and wouldn't do
anything to test the Falcon's architecture, invalidating the point.

Which doesn't affect the benchmark, which is the point: Adding a new CPU
with local ram has nothing to do with the architecture of the Falcon
unless it's accessing motherboard ram--that depends on the architecture
of the CPU/RAM card.

If you're going to compare a Falcon to an A1200, then you're stuck with
the Falcon's processor, and the a1200's processor. ANYONE can toss in an
accelerator card into either system, and have local ram, and get a
performance increase, but then you're benchmarking the card, and not the
system.

Get it?

: Wow. That's real similar. :)

Very similar, despite the narrow-minded attempt at brushing it off. The
parallels exist, architecturally, and that was the point of the statement.

Ah, but most things you do are not necesarily loops and when they are
they are over a huge area (when moving memory). Not like those stupid
benchmarks so that the data could fit in the cache.

True, wich is why the benchmark is misleading.

```
|> Also, let's think about what the code that creates relatively large
|> uncacheable loops is doing.. is that code doing a lot of move ops?
```

No, but again, you are not doing loops all the times. *EVEN* when
you do loops, you have to break from it if the loop is long. Remember
the Vertical blanks interrupts? And if you are Multi-OSing then you have
to do context switches, etc. THOSE BENCHMARKS ARE NOT A REAL LIFE SITUATION.

```

```

That would be a good test mixed with I/O. I would say this would
be a very good test but not a definitive one (as it check IDE performance,
which is true for some applications and not true for others). I AM SAYING
THIS NOW EVEN IF THE A1200 turns out to be faster, ok? Your proposed test
sounds like a good one where applications need to look for hardisk access.

|> For all I know you may just have a bum '030 upgrade. :) Chill. :)

Flip: THE CSA accelerator is the FASTEST and one of the very best designed
accelerators available for the A1200. It was designed by CSA wich is
a Motorola consulting company and has been in business for more than 10 years.
The 12 Gauge is not their first design on the Amiga either. I CAN'T
BELIEVE IS A BAD DESIGN.

[stuff deleted]

|> Isn't that what I said? Run a loop of code that exceeds the size of

It has an instruction cache. It doesn't have a data cache.
And your fellow Atarian Heiko didn't mention whether he was running
with the '020 cache on or off, wich is another reason why I am so
skeptical.

But BTW, it still proves nothing. Hey, if the A1200 had a 68030
at the same speed of the Falcon, both machines should do almost
exactly the same result. Would this be fair even if this theoretical
A1200 with a '030 had 32-bit access to memory and the Falcon still
the 16-bit access on a real-life situation ? NO!

Baloney. Mine works just fine. The only problem I have seen is
the temperature, which all requires is that you have either a fan
or the machine in an air conditioning environment.

The Board I told you up the was the Microbotics, wich can be had
for $600 with 4 megs fast ram and a 50Mhz '030. Actually checking out
the last AmiWorld: $349 + $139 = $488. Hey, it's even $112 less than
I said! You want to call them? Memory World: 1-800-CSA-XLR8.

|> So what works
|> for you might not be available or possible for everyone else,
|> especially if their dealer advises against it.

No. This board works fine. Same goes for any expansion of the Falcon
too anyway (those that actually exist).

How much is the US Falcon? With what?

True, but in my case I was one of those first to admit that the
Falcon's sound is awesome, and that the DSP is a very nice feature
indeed.

And, ok, I'll chill out :-)

>

Ok, my point is this:

1) if we're moving a large chunk of memory, especially graphic data, both
machines will use their Blitters, which have 32-bit access to RAM. No
crippling for the Falcon in that case.

2) if the loop being used to move a chunk of memory is a simple dbra loop
that fits in the cache, the Falcon will do fine.

Now if both of those possibilities don't exist in the code, the Falcon may
be punished. But then it becomes a matter of whether the compiler generates
code for #2 as opposed to unrolling the loops whenever possible. If it
doesn't unroll the loops, most of these loops will fit in the cache and
the Falcon would burn the A1200 in those cases.

<my real expectations: on a decent mix of code, i'd expect them to run
roughly equal...>

>
> True, wich is why the benchmark is misleading.
>

Well, please check the argument i have above.. basically it is determined
by the compiler's method for loops, and whether or not it unrolls it....

In fact, one interesting thing about GNU C will be that if we compile a
benchmark C program on both, and do an -funroll_all_loops (i think that
is it) it should generate code that works better on the A1200 provided
the 32-bit vs. 16-bit buss problem is as extreme as believed.

But on normal loops (which would fit in the CPU cache) the Falcon should
be a bit faster.

> No, but again, you are not doing loops all the times. *EVEN* when
>you do loops, you have to break from it if the loop is long. Remember

>to do context switches, etc. THOSE BENCHMARKS ARE NOT A REAL LIFE SITUATION.
>

That's true, especially about the multitasking OS. However it's a fact
that even now, some people would run a Falcon single-tasking to eek out
performance for some applications that are memory or CPU hungry. After
all, MultiTOS is loadable.

Ok. I think it's agreeable that this be it. How about we all look for
a nice, large, gigantic, monolithic C program to compile?

In fact, one of those Obfuscated C code contest winners would probably
make the pre-processor do all kinds of contortions to figure out what
is going on. :)

Which benchmark are we talking about? The A1200 vs. Falcon one or just
general usage?

Surely having a 32-bit path from custom chips to RAM improves their speed.

The point is, the A500 with an 030 accelerator has 16-bit data path
from the custom chips to RAM, and a 16-bit path from the 030 to the
chipRAM (or any 16-bit fastRAM) and a 32-bit access to its local fastRAM.

The Falcon would have all custom chips operating 32-bits to/from chipRAM.
On a 16mhz buss, as opposed to a 7.16mhz buss. Clock speed is more than
doubled and buss width is doubled.

The CPU would have one similarity...the 68030 would have 16-bit access to
chipRAM but 32-bit access to the local fastRAM.

Now, there is that one similarity... but remembr that the 68030 is likewise
accessing that RAM off a 16mhz board. That means it's running at LEAST
2X faster than the '030 expansion on the A500, right?

(i.e., same bus width, > 2X increase in bus speed)

Factor in the fact that the Falcon's custom chips are running 32-bit to
RAM and are running more than 2X faster than the A500s chips and you'll
see the throughput is definitely way beyond an expanded A500.

>If you're going to compare a Falcon to an A1200, then you're stuck with
>the Falcon's processor, and the a1200's processor. ANYONE can toss in an

>system.
>

So if I compile something with a 33mhz 68030 in a Falcon in 3 seconds,
I shouldn't be happy?

Maybe you should talk to Ricardo and ask him about how he can't benchmark
his A1200 with the CSA 68030@50mhz, huh?

I say, if he's got it, and it works, it's admissable. He uses it, and
it works for him. If a Falcon owner has a 33mhz 68030, let him bench it.

(for now, if we compare base systems, which no one has done yet, both should
be interesting!)

Are you saying that the Falcon's memory bus is 32 bits wide? If so,
what possible excuse could they have for limiting the CPU access
to memory to 16 bits, especially when the chosen CPU was designed
with a 32 bit bus from the beginning?

If your statement is true, my opinion of Atari Engineering goes from
feeling that they're not very good to feeling that they're completely
incompetent.

> the effects of the cache are just too generous.

Yes this is a problem. In normal programms there is a cache hit rate of
70-80%. Maybe you can write a benchmark with these hit rates?

> 2. No mention if the '020 cache of the A1200 was turned on or off

The caches in both machines were turned on. I don't know anyone turning
his caches off when he wants to run time-intensive programs.

> 3. You didn't try the benchmark with words on a lower resolution, less
> colors mode on the A1200 and F30.

Sorry! I didn't have the time (after 3 hours you want to make other things
than benchmarks). You can calculate the times if you want.

> 3. You ran *ALL* the benchmarks in at 60Hz, which the bus contention
> on the A1200 starts to make a stronger mark. If you had Fast RAm

Sure. What's your point?
Both machines were in 60Hz-mode. Where is the problem?

> I did, check my comments. The information you present is not reliable. Did

Most programs gain 50% or more (see my earlier posting).
Without caches, the test has needed 43.1 s, with caches 21.3 s. This is an
improvement of 50.5800464...% but never 75%.
It is very hard to write a program which does not fit in the caches :)

Ciao, Heiko.

>to a '040! (which is not true).

Here is the reply form the "guy":
The test without caches neede 43.1 s and the test with caches needed 21.3 s.
That means: the F30 is 100% slower without caches or 50% faster with caches.
The improvement is 50%. I don't know how to get 75% with these figures...
Nearly all programs that i have tested get a 50% improvement caused by
the caches. These tests are not as easy as it seems because you only have to
check the calculation time (many programs spend a lot of time with I/O).

Ciao, Heiko.

|> crippling for the Falcon in that case.

Don't assume that much. If you are making an animation you'll have
to use the CPU to move memory regardless of how wonderfull the blitter is.
And second, you have to take into consideration that the Falcon's blitter
has to do (for bobs) I think it was twice or three operations per one
Amiga blitter operation.

|> 2) if the loop being used to move a chunk of memory is a simple dbra loop
|> that fits in the cache, the Falcon will do fine.

For the instruction cache yes, but not for the data cache, wich is
what happens in those 'benchmarks'. And again, this is not the
real-world situation, as programs do not consist of this.

|> Now if both of those possibilities don't exist in the code, the Falcon may
|> be punished.

AND IT IS BEING PUNISHED. Why? Because in a real-life situation
this is not the case.

And you know what? NO MATTER HOW MUCH ATARI PEOPLE ARGUE ABOUT THIS
BENCHMARKS, THEY SHOW NOTHING. AGAIN, I GOT A '030 COMPUTER AND
THE CACHES DO NOT GIVE IT 75% IMPROVEMENT THAT IN THE FIRST BENCHMARK
THE CACHES GAVE TO THE FALCON. THIS CLEARLY SHOWS THAT THE BENCHMARKS
DO NOT SHOW ACTUAL WORLD PERFORMANCE WITH REAL APPLICATIONS.

Sorry Flip, but I can't see nothing more *OBVIOUS* that what I am saying
with the above.

|> But then it becomes a matter of whether the compiler generates

Flip, A REAL WORLD APPLICATION DOES NOT CONSIST OF A STUPID LOOP.
And again, no matter how people here want to justify those benchmarks,
I have SHOWN THEY ARE NOT VALID! NO MATTER HOW MUCH SPECULATION!

MY COMPUTER DOESN'T GET 75% IMPROVEMENT!

|> In fact, one interesting thing about GNU C will be that if we compile a

|> all, MultiTOS is loadable.

Flip, you still have to deal with interrupts and if I am correct,
the Falcon as all computers as a VBLANK interrupt. That's 1/60 of a second
it get's interrupted + any other possible interrupts.

|>
|>

|> >
|>
|>
|> Ok. I think it's agreeable that this be it. How about we all look for
|> a nice, large, gigantic, monolithic C program to compile?

That depends on what you say by 'that this be it.' I said it would
be a good test of a situation where programs use hardisk I/O. IT ISN'T
A GOOD BENCHMARK FOR SAY, A WORDPROCESSOR OR A DESKTOP PUBLISHER, OR
A SPREADSHEET BECAUSE THOSE DON'T USE I/O A LOT.

Sorry for 'shouting' but I just wanted to make clear that I agree
depending on what you mean by the 'that this be it.' I don't think
that this test alone will prove everything, but a particular set
of applications. I say do this test and others.

For example, say that you use a SCSI hardisk on the Falcon, I would
expect the Falcon to blow away the A1200 IDE. But that still doesn't mean
that the A1200 (this is all theoretical, just to show you my point)
would be slower using a wordprocessor, ray tracing or something like that
because the I/O is not involved in these other applications.

You proved that the Falcon is faster compiling when using a SCSI
hardisk.

Do you understand what I am saying? (no flames, no irony intended)

Why? BECAUSE THE BENCHMARKS PROVE NOTHING!

DON'T YOU JUST GET IT? I have a '030 setup and enabling the caches
on my applications DO NOT GIVE ME A 75% PERFORMANCE BOOST THAT THE
FIRST BENCHMARK DID TO THE FALCON. THEY GIVE ME LIKE 12% ON AVERAGE.

NO MATTER HOW MUCH YOU SAY: "DUH, Amigoids don't WANT to do
the benchmarks", ETC. IS BECAUSE IT PROVES NOTHING!

ARE YOU A REAL PROGRAMMER OR WHAT? ISN'T MY EXPLANATION ABOVE
SO HARD TO UNDERSTAND?

A word processor? A Spreadsheet? A ray tracer? An Image processing
program? No way you can fit those in a 256-byte cache. Are you using
MultiTos? Kiss the caches good bye on a lot of occasions.

Have you ever heard of Vertical Blank interrupts?

|> (You wouldn't believe the speed of my newly developed 030-line routine in true
|> colour .. ahem .. )

Ah, a demo? Good show of a real-world application.

And I guees your routine gets called from elsewhere, which again flushes
the cache at some point. THis is not to say that the '030 doesn't benefit,
but that it's not the way you put it.

|>
|> RH> Ah, not to mention that now the A1200 go a drop in price as well.

LAN-> get the CSA card then. Add about $200 and you'll get arcnet.
Leaps and bound faster than your Lan. Midi? Add $50.

I'm missing the SCSI II and 16-bit sound but then,

You have to add sprites and dual-playfields to your system anyway
and a 24-bit color card or something better than the stupid
64k colors 'true color'

BZZZZZZZZZT! Thanks for playing.

Good luck doing that. YOu know, dual-playfields is not just
separating 'bit planes'. It's like having a whole screen on top
of another which is like a huge sprite in top of the other.

THERE's NO WAY THE FALCON CAN DO THE SAME.

>post it soon...

It's probably a 257 _Byte_ loop. This does exceed the cache but as the
020 and 030 instruction cache is direct mapped it will just have to reload
a single longword in each pass through the loop. You need a loop size of
>= 512 Bytes to make any caching effects invisible.. but then you could
simply turn the caches off.

If the 257 Byte loop doesn't use any 030 pecularities, doesn't use data
memory and keeps the first loop instruction longword aligned you should
see exactly the time needed to prefetch a longword. This is one 32bit
access for the A1200 and two 16bit accesses for the F30.

>The improvement is 50%.

Well, halving the time needed is surely an improvment by 100%. Anyway, the
caches become more valuable (for small programs) the slower the memory is.
For large programs the memory speed becomes more important.

Well. That says something about the size of programs you write.

*Sigh*

Ok, as I intended to do it anyway I can just as well promise it now:
I'll write a set of benchmarks that will test just about every part of the architecture that I can think of. Some of it will be F030 positive, some will be 030 positive, some will perhaps be 1200 positive. What do I know, I only have a 68000 on my Amiga right now. (But rest assured, I'll upgrade very soon.)

Then you people can go back and test the programs, ok?

(I guess it might be as many as 64-128 different benchmarks, but with a few macros it shouldn't be too hard to squeeze into an article.)

I can't remember where I saw the FA/18 demo but the Star Trek one is
available from sumex. For convenience I have copied the following
snippet of info from the sumex game directory:

---

#### BINHEX star-trek-demo.hqx ****

From "Bill Dugan <interpla@orion.oac.uci.edu>" Tue Aug 24 23:09:00 1993
Date: Tue, 24 Aug 93 01:27:31 -0700
From: Bill Dugan <interpla@orion.oac.uci.edu>

StarTrekDemo.sea.hqx

This file is a playable demonstration of MacPlay's new game for the Mac,
"Star Trek: 25th Anniversary". You need a color Macintosh with System
6.0.7 or later. A 68030 or later is recommended; the faster, the
better.
The demo lets you play through one ship-to-ship combat in the space
simulator part of the game -- you get to pilot the Enterprise against
another Constitution-class vessel in a simulation -- and then you can
play through one room of the "ground-side missions," the adventure-game
aspect of the game which constitutes the majority of the game.

Please go ahead and distribute this demo everywhere.

It is copyright (C)199 Interplay Productions.
"Star Trek" is a regis red trademark and copyright to Paramount
Pictures.

interpla@orion.oac.uci

## 1911. PC lordship

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-17 17:15:40 UTC
From: rcmerrit@apgea.army.mil
Message-ID: <1993Sep17.171540.15599@apgea.army.mil>
Source record: 21356
Cross-posted to: comp.sys.amiga.advocacy,comp.sys.atari.advocacy

Here is a question for you.

Why did the IBM (or Intel if you wish) PC become so dominate?

Its already taken over in the US and I've heard that clones are threating
the europe market to.

My computer history includes from a Commadore Vic-20,Colleco Adam, Atari 400
(used), Commadore 128 (used), Tandy 1000ex, 386 sx, 486 dx

In highschool, I needed a more powerful computer, so my dad went out looking.
The choices were a Clone, and a Mac. This was 1986 and you couldn't find
a store that sold an Amiga nor a Atari st. So, we got a clone. And even
back then, it seemed that 80% of the new software was IBM. (there were
more Amiga and St games out. And they just HAD to show those pictures instead
of the sucky IBM versions on the back of the box. Every game purchase was
an adventure)
Then came 1990. I was in college, had a good paying job, I wanted a better
computer. So this time I went out to look. I couldn't find an atari
dealer, in fact I could find an atari st owner period. Besides, everyone said
atari would be dead in a year. So I looked at amigas. I wanted to get one
with some memory and a hard drive. The only amiga that had thoses was close to
$3000. (I didn't know the 500 could be upgraded to a hard drive and neither did
the dealers that I talked too) and most of the games weren't even hard drive
installable. But the worst part was that most amiga deallers were working
in dirty stores and really didn't seem to care if you bought one or not.
Then Wing Commander came out for the clones. I was sold to a PC without even
really looking at one. (well, I did shop for awhile) And when I got it home,
I began the experience thew nightware that was dos 4.01 but this isn't the
place for that discussion..

fall 92. I once again decided upgrade to a 486. However, I did find a
few deallers that seemed professional. Anyways I waited for the
Falcon and the Amiga 1200 to give them a fair shot. And I waited, and waited..
Eventually the Amiga guy told be to buy the 486 but remember the amiga when
I want to upgrade again in a few years and talk to him. He is doing well
the last time I talked with him. I might by a used Amiga 500 off of him soon
for a toy. Anyways, I called the Atari dealer and he was highly upset to be
not getting my business, and he said aoon he'd become a clone dealer
soon if this continued. I looked at macs but wasn't impressed.

Anyways, my point is, I never really had a prefance towards the pc, however, it
seemed all the factors FORCED me into a PC clone.
(BTW, when I say PC, I mean those based on the Intel format)
So is it simple the lack of availablity the reason the other formats aren't

doing well?
And now both companies apear to be activly becoming videogame companies. So
is it true that in 95 or so, that the pc will be the ONLY choice?

Q: At the most recent shareholders meeting, Sam Tramiel commented that
although the Falcon030 was not selling as well as anticipated, Atari
is nonetheless committed to staying in the computer market and that
there will be additional Falcon models. Can you please tell us about
some of the models under consideration?

>From Bob Brodie:
Sorry, it is not our policy to discuss unannounced products. I am
happy to confirm for you that as we stated when we announced the Atari
Falcon030, there is a new family of computers being produced by Atari.
The Falcon030 is the first of that family of computers. I've seen
prototypes of future machines, and I believe that you'll be pleased

with the results.

>effect.

Yes, you are right, unless the Falcon is real strange - 4 latches should
do, but then why not a 32 bit bus in the first case.

Because there wasn't any gain in throughput to speak of?

I concluded that the Falcon used burst fill because it's cacr read 0x3111,
which means write-allocate, data-cache, instruction-cache, data-burst,
instruction-burst.

It is probaly a leftover from the TT...

Yawn. One day EA will actually start doing interesting games again.
I also have it on reliable authority that EA are very interested in the
Jaguar and are taking it very seriously. So you could see Madden Football
on Atari hardware yet.

## 1916. Atari, IBM, and Jaguar

Newsgroup: comp.sys.atari.advocacy

From: khaley@nova.gmi.edu
Message-ID: <khaley.748297201@nova>
Source record: 21352

In the September 1993 issue of Computer Shopper, the article on page 110, "Summer Sundries at PC Expo", mentions a $500 million deal with IBM to manufacture the Jaguar. Obviously, with $500 million put into this project, Atari is going for the big push to bring the Jaguar into homes and carve a big chunk of the computer game market for itself. Hopefully this effort will succeed... if it doesn't, I can't see Atari coming out of a $500 million disaster alive.

(Actually, I remember a time when Atari had the resources and manpower to manufacture all of its own products.)

Rich, I'll say the PCs have the best price:performance ratio, but I've
thumbed through the latest computer shopper (usa) and I don't see any
"usable" 486DX2/66 machines for $1200.

I do see a ton of 486SX-25 and SX-33 machines in the $1000 area with monitor.

But what are we getting for that $1200? I've seen a complete DX2/66 box for
$1500-$2500. With most of the nicer options i'd like on it, it's usually
around $1800 and up... (4MB, Localbus IDE or SCSI, 340MB HD, 24-bit video
on localbus, etc...).

Can you be more specific about these instances?

What I'm talking about is just the simple blit from a single-source to a
single destination. That's the most common operation on most machines,
right?

>|> 2) if the loop being used to move a chunk of memory is a simple dbra loop
>|> that fits in the cache, the Falcon will do fine.

>

Well, geez, WHAT THE HECK DO PROGRAMS DO IF THEY DON'T USE A DBRA LOOP?

Either a program HAS a loop or it unrolls the loop. Period. What else can
it do?

If the loop is unrolled, it may not fit in the cache... the Falcon's (and
A1200's) instruction cache takes a hit.

It it is NOT unrolled, then it might just fit in the cache.

That's it.

Try this and see what happens with a decent disassembler:

```
#include <stdio.h>

main()
{
int i=0;

for(;i<1000;i++)
printf("%ld\n",i);
}
```

Go ahead.

>|> Now if both of those possibilities don't exist in the code, the Falcon may
>|> be punished.
>
> AND IT IS BEING PUNISHED. Why? Because in a real-life situation
>this is not the case.
>

Ricardo, GET THEE TO A DISASSEMBLER and tell me what new method we have
for looping that either:

a) doesn't unroll the loop and create towers (which break caches)
or:
b) keeps it the same, as a loop, which may indeed fit inside the cache for
many operations.

Do you realize how many times your CPU is asked to do string compares, copies,
etc. in the course of a typical execution?

Now, if you have a fairly sophisticated algorithm, it probably won't fit into
a 256 byte instruction cache. That's a given. But if it is indeed composed
of smaller parts that DO (like string compares... etc...) you will find that
those sub-parts are speed up tremendously!

> And you know what? NO MATTER HOW MUCH ATARI PEOPLE ARGUE ABOUT THIS

>DO NOT SHOW ACTUAL WORLD PERFORMANCE WITH REAL APPLICATIONS.
>

I never said the original benchmarks were accurate for real world apps....
only that in optimal circumstances a stock Falcon does perform much better

than expected (and actually beats the A1200 handily with no FastRAM.

>home computer with DSP. So I would use some MIDI setup.
>

You're dead wrong. The music is created the MIDI equipment but the actual
audio signals are recorded (digitally) from the mixer back to the computer
(which is currently also sequencing the midi!) directly to the hard drive.

This yields pure, 16-bit digital audio versions of your songs. Most budget
musicians don't even have 16-bit keyboards BUT if you
want to maintain the character of your sound, and get it just the way it
sounds from your mixer's headphones on your final version... this method is
superior to say, going to a 4-track.

>>Can be used as a D2D interface; DAT/CD digital out to DSP in.
>
>Possible. But you can buy that for Amiga too.
>

And what program would I use on the Amiga for this? Cubase Audio? :)

This is about as ludicrous as me saying that just because the ST line has
some nice high rez graphics cards, the Toaster is meaningless. The platforms
are aimed at two different markets and that is the final fact.

Why would EA, whose president founded 3DO, publish ANY software for the Jaguar?
I would think they would be too busy trying to eradicate any competition,
particularly from a company that is already challenging their standards.

I doubt the PC will be the *only* PC choice in 1995...Businesses use all types of computers...an IBM clone isn't the only choice and doesn't serve all business needs.

Remember the PowerPC is coming, which is once again a new era in computing -- it is going to shake computing and win over IBM cloners. Given a choice of running all popular software off one computer is "cool" and by itself warrants the move to PowerPC. True OS/2 2.1 is currently doing this, an OS that provides 32bit processing power and can run not only applications of its own, but Windows 3.1 and DOS. It will be interesting to see how the PowerPC is accepted.

Technology constantly changes and evolves into new concepts and standards...we are human, we are never satisfied, we always want to improve what we create.

Which has nothing to do with a 'sound' system in the computer or having a
DSP at all. If your MIDI equipment is purely digital you just want some
data aquisition port, if your MIDI equipment is analog you want a high
quality ADC port.

I'm also not that convinced that the Falcon's analog input can be compared
with the much more expensive samplers used in studios. If you have digital
music instruments this is not so much of a problem though but then such
a digital port isn't very exciting.

You do something that takes a long time. That simple.

Alternatively, you use a program to do the timing for you using the built-in
timers. That way you can get at least 100us accuracy.

>acc. only gives you a 12% boost!

Your 16MHz 68000 has probably a 16kByte cache.. this is a large cache compared
to the 512 Byte cache of the 68030. Also, the cache is twice as fast as the
memory system, for a reasonably designed memory system the cache is just 50%
faster and even less if the memory system supports burst mode. In this case
the cache just helps for the few bus conflicts (where the CPU wants to fetch
data and read instructions at the same time), it also decreases bus-usage in
multi-processor systems.

So it is very easy to explain that you see a large boost while he sees only
a small boost.

I shouldn't think they actually spent $500.M. all at once, probably a
forecast for the next twelve months in payments to IBM if production
is ramped up.

>(Actually, I remember a time when Atari had the resources and manpower
>to manufacture all of its own products.)
>
Given the press coverage, I'de say they have a more than fair chance of
making a go of this one. What they must do is get a 'Mario' or 'Sonic'
style character to market the machine. It mustn't be some half-baked
obvious attempt to copy these character either, a good marketing company
could definately help out at Atari with some cool ideas here.

It has nothing to do with the Falcon's sound system, eh?

So how do we play back what we just recorded to the hard drive? Buy a Video
Toaster? :)

The thing is, the Falcon has a built-in 16-bit 4-channel stereo DMA sound
system. It also has a DSP that can perform *real-time* operations on the
stream of data going to and from that sound system.

Now, the actual quality of the DACs probably can't hang with a good pro DAT.

But that's where the DSP port comes in as a low-cost, standard, high-speed
connection for such DACs.

Also, I have yet to see a MIDI keyboard with digital outs, i.e., the optical
in/out you see on some CD players and MiniDisc units.

<although some are certainly going to sport this in the future>

What a jerk. Read again. Let me quote myself for you:

|> RH> DON'T YOU JUST GET IT? I have a '030 setup and enabling the caches
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
|> RH> on my applications DO NOT GIVE ME A 75% PERFORMANCE BOOST THAT THE
|> RH> FIRST BENCHMARK DID TO THE FALCON. THEY GIVE ME LIKE 12% ON AVERAGE.
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
/ This refers to the caches
of the '30, not the '030 itself.

My '030 is several times faster than my stock A1200, wich is why I bought
it.

|>
|>
|> RH> ARE YOU A REAL PROGRAMMER OR WHAT? ISN'T MY EXPLANATION ABOVE
|> RH> SO HARD TO UNDERSTAND?
|>
|> Yup. If you don't like these benchmarks - do your own. Or maybe you're afraid
|> to see the results?

I am not. Like I said, no matter how much ATARIANS try to justify them
I have SHOWN they show nothing. You can't get 75% improvement on '30 caches
on real world applications.

Ah, BTW, I was wrong... the improvement on the Falcon by using the caches
was about 100% not 75%, wich means the machine was twice as slow when

accessing the memory, which makes sense since the Falcon as a 16-bit crippled
data path.

```

>
>Here is a question for you.
>
>Why did the IBM (or Intel if you wish) PC become so dominate?

I prefer to call them "Clones" instead of IBM's or PC's as they are not all built by IBM and PC covers Amigas, Macs, and other machines as well. Some have argued that "clone" is more appropriate, however, I prefer to think of "Clone" as being a proper name of sorts. :-)

Anyway, enough of my babbling. I believe that one of the main reasons that Clones have become dominant is because they are clones. That is, the vast number of people competing for sales of similar machines have driven prices downward at an unbelievable rate. In recent years we have seen prices for the 386 and now the 486 drop to the point where it is difficult if not impossible for non-Clones to compete. Apple appeared to be immune for a while, but even they are having to slash prices and develop "cheap" machines. The Amiga used to offer more bang for the buck than the Clones, but Commodore has not kept pace with the price drops and the current Amigas, especially the A4000's, look a bit silly in a hardware vs. hardware comparison.

Now, before anyone jumps to conclusions, let me state that I do not feel that the Clones are better than the Amigas or Macs, at least in their original forms. Anyone who has ever had to deal with a Clone for any length of time will have horror stories to tell, especially if they have been involved in configuring or programming the beasts. But, it is also the case that things have not stood still for the Clones, and perhaps their inherent "badness" is what has caused them to improve so much in so short of time. If the Amigas of today had improved as much as Clones have in the same timeframe, we would now be using >=50MHz 040 or 060 machines with post-AAA chipsets and who knows what else. Just compare an AT from 1985 with one of the DX2-66 or Pentium machines and you'll see what I mean.

>Its already taken over in the US and I've heard that clones are threating
>the europe market to.

Well, it has taken over the US, but there is still some hope that the PowerPC will be able to change this in the future. I really don't have much hope in the Amiga ever seriously mounting a challenge to the Clones in anything but a few areas, but it could manage to survive if Commodore figures out what they want to do with it and quits

sitting on their hands.

>My computer history includes from a Commadore Vic-20,Colleco Adam, Atari 400
>(used), Commadore 128 (used), Tandy 1000ex, 386 sx, 486 dx

Yikes, sounds like an orphanage! :-)

>In highschool, I needed a more powerful computer, so my dad went out looking.
>The choices were a Clone, and a Mac. This was 1986 and you couldn't find
>a store that sold an Amiga nor a Atari st. So, we got a clone. And even
>back then, it seemed that 80% of the new software was IBM. (there were
>more Amiga and St games out. And they just HAD to show those pictures instead
>of the sucky IBM versions on the back of the box. Every game purchase was
>an adventure)

I was lucky in that there was an Amiga dealer nearby in 1986, heck,
there used to be several Amiga dealers in this state at that time!
Most are now either out of business or have converted to Clone shops,
with the occasional piece of old Amiga software on the shelves. :-(

>Then came 1990. I was in college, had a good paying job, I wanted a better
>computer. So this time I went out to look. I couldn't find an atari
>dealer, in fact I could find an atari st owner period. Besides, everyone said
>atari would be dead in a year. So I looked at amigas. I wanted to get one

What's an Atari? I think I heard about them a few years ago... :-)

>with some memory and a hard drive. The only amiga that had thoses was close to
>$3000. (I didn't know the 500 could be upgraded to a hard drive and neither did
>the dealers that I talked too) and most of the games weren't even hard drive
>installable. But the worst part was that most amiga deallers were working
>in dirty stores and really didn't seem to care if you bought one or not.

What do you mean by "dirty stores"? I would guess that you mean the
little hole-in-the-wall type shops that many Amiga dealers end up in.

>Then Wing Commander came out for the clones. I was sold to a PC without even
>really looking at one. (well, I did shop for awhile) And when I got it home,
>I began the experience thew nightware that was dos 4.01 but this isn't the
>place for that discussion..

MSDOS 6.0 is also a nightmare of sorts. A coworker (also an Amiga
dude) has had tons of trouble because of the DoubleSpace virus that
MSDOS 6.0 is infected with.

>fall 92. I once again decided upgrade to a 486. However, I did find a
>few deallers that seemed professional. Anyways I waited for the
>Falcon and the Amiga 1200 to give them a fair shot. And I waited, and waited..

If you had been an Amiga owner already, the wait wouldn't have been so
tough. Most of us now have the patience of Job. :-)

>Eventually the Amiga guy told be to buy the 486 but remember the amiga when
>I want to upgrade again in a few years and talk to him. He is doing well

>the last time I talked with him. I might by a used Amiga 500 off of him soon
>for a toy. Anyways, I called the Atari dealer and he was highly upset to be
>not getting my business, and he said aoon he'd become a clone dealer
>soon if this continued. I looked at macs but wasn't impressed.
>
>Anyways, my point is, I never really had a prefance towards the pc, however, it
>seemed all the factors FORCED me into a PC clone.
>(BTW, when I say PC, I mean those based on the Intel format)
>So is it simple the lack of availablity the reason the other formats aren't
>doing well?

Partially. If you walk into the store and see hundreds of titles for
another format, it's a bit depressing when you see only a few for the
one you own or use. I remember a few years ago when the Amiga had
more games available than any other platform and how the Clone users
went nuts. This is not the case now of course, and its the Amiga
users' turn to be crazy.

>And now both companies apear to be activly becoming videogame companies. So
>is it true that in 95 or so, that the pc will be the ONLY choice?

Nah, PowerPC will do okay and maybe something else.

# 1937. Falcon Benchmark Nonsense

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-18 19:04:57 UTC
From: ricardo@rchland.vnet.ibm.com
Message-ID: <1993Sep18.190457.16489@rchland.ibm.com>
Source record: 21372
Cross-posted to: comp.sys.atari.advocacy,comp.sys.amiga.advocacy

Well, in reference to those Heiko's benchmarks that some people forgot
to sprinkle with *tons* of salt, where supposedly the A1200 was slower
than the Falcon, and noticing that the Falcon did remarkably well by
enabling those benchmarks and *IN ADDITION* reading so much nonsense
about how the 256-byte icache and dcache of the '030 will speed up
the Falcon I did the following:

Sombe background:

I got a 68030 accelerator on my A1200. Looking at the ONLY benchmark
that was done on the Falcon with and without caches we notice that
the Falcon did:

43.1 seconds no caches, 21.3 seconds with caches.

43.1/21.3 = 2.0234742 times faster with the caches.

This means that the Falcon did 102.34742% faster with the caches. I
was wrong! It wasn't 75% but 102% aprox! This makes the benchmark
even more biased than I thought!

But as we'll see below, I was also wrong on the speed-up of the '030
cache on the average huge world application. Is more than 12%, like about
25<->30%

Since some people that are even supposedly programmers can't be skeptic
about this figure, I ran a couple of benchmarks in my machine. Figures
are for the operation with: 1. no caches, 2. both caches- no burst mode,
3. both caches with burst mode (the Falcon can't do the latter, thanks
to its 16-bit data path from the 68030. Motorola requires 32-bit access
for this).

Program Test Description Cache status Time

Scenery2.0 Render a scene in iff24 to no cache no burst 68 secs
the RamDisk
both caches no burst 52 secs

both caches w/burst 47 secs

---
Image F/X Make a Wave Distort Effect no cache no burst 33 secs
both caches no burst 28 secs
both caches w/burst 25 secs

---
Real 3D: Render 3 primitives in no cache no burst 27 secs

LampLess mode with both caches no burst 23 secs
a mirror default textures both caches w/burst 22 secs
(so they reflect each other)
Image is rendered to RamDisk
in an IFF24 file
---
LHA Compress DpaintIV from no cache no burst 19 secs
a Ramdisk file to Ramdisk both caches no burst 13 secs
both caches w/burst 12-13 secs
---

All tests running in DoubleNTSC, at no more than 16 colors. My point is
not proving bus contentions of the A1200, but the improvement of the
'030 cache on real-world applications.

All tests running in WorkBench, multitasking with the clock utility.
I didn't use forbid(), so the machine is multitasking.

Program Improvements %'s thanks to the caches:

Scenery Animator 2.0 30.7% improvement both cache vs no cache
45% improvement both cache w/burst vs no cache

Improvement of burst mode: 14.3 %
---
Image F/X 17.8% improvement both cache vs no cache
32.0% improvement both cache w/burst vs no cache

Improvement of burst mode: 14.2 %
---

Real 3D V2.0 17.4% improvement both cache vs no cache
22.7% improvement both cache w/burst vs no cache

Improvement of burst mode: 5.3 %
---
LHA 46.2% improvement both cache vs no cache
xxxxx just a tad faster with burst mode

Improvement of burst mode: just a tad
faster

---
---

Conclusions:

*The very best improvement I could obtain from the caches
was just a tad above 46.2% This isn't even the average case,
and it is still way below the Falcon's 102.xx% improvement.

*A theoretical 68030 with a bigger internal cache would
give any 68030 machine (and particularly the Falcon) a better
real-world performance.

*Atari could have made a secondary external cache of
say, 16k or 32k and it would have benefitted the Falcon immensely.
The didn't.

*The Falcon doesn't support Burst Mode because the Motorola 68030
requires a 32-bit datapath plus special memory or memory subsystem
for enabling this mode.

*In the ONLY test that the Falcon had its caches turned
off it was a tad over TWICE as slow. This could reflect the
16-bit crippling.

*LHA is a relatively small compression/decompression program.
This type of program will probably benefit more from the caches
than other type of programs because of what it is doing and its
size.

*The whole average for improvement is around 28%, taking
LHA into account. Discounting LHA is around 22%.

*Taking the above percents the Falcon's 43.1 should go
down to between 33.67<->35.32 secs aprox. If I remember correctly,
even the A1200 without FASTRAM did about 31.xx With FastRAM
the A1200 usually speeds up at least 1.5 times. 31/1.5 = around
20.66667 secs.

Definitively the Falcon can't get 102% improvement on the caches on
a real-world application. This vast improvement not only reflects how
bad the cache is measuring the performance, but also points out as to
how bad is the Falcon's access to memory.

No matter HOW MUCH people want to believe in those 'benchmarks',
THEY ARE NOT SHOWING REAL-WORLD PERFORMANCE.

Probably. Still, it can't use burst mode.

If Atari makes the chips on their Jaguar available on a future Falcon computer, then they'll kick butt, as long as they can keep the price down and the Jaguar chips are capable of doing what they supposedly can do.

And if they get the developer support (i.e. The Software)

|>
|> What I'm talking about is just the simple blit from a single-source to a
|> single destination. That's the most common operation on most machines,
|> right?

No. You have to do AND/OR operations most likely. Take as an instance
the arrow pointer. The blitter doesn't blit irregular shapes, but a square.
You need to somehow have an outline of the shape and then do boolean operations
against the background to 'cut' your shape and mix/put your shape in.

This would happen in games with backgrounds too.

|> >|> 2) if the loop being used to move a chunk of memory is a simple dbra loop

|> >
|>
|>
|> Well, geez, WHAT THE HECK DO PROGRAMS DO IF THEY DON'T USE A DBRA LOOP?

Well, geez, PROGRAMS ARE NOT LOOPING ALL THE TIME!

|>
|> Either a program HAS a loop or it unrolls the loop. Period. What else can

```
|> it do?

NOT HAVE A LOOP AT ALL. I mean, an application is not 100% LOOPS!

|> If the loop is unrolled, it may not fit in the cache... the Falcon's (and
|> A1200's) instruction cache takes a hit.

Read above. Anyway, the data cache would take hits (read above).

|>
|> It it is NOT unrolled, then it might just fit in the cache.
|>
|> That's it.
|>
|> Try this and see what happens with a decent disassembler:

|>
|> for(;i<1000;i++)
|> printf("%ld\n",i);
|> }
|>
|>
|>
|> Go ahead.

Flip... READ ABOVE! And guess what: you are jumping there to a library
function (printf). Guess what happens with the instruction cache...

<proof is left as an exercise to the student :-) >

|> b) keeps it the same, as a loop, which may indeed fit inside the cache for
|> many operations.

FLIP, MY WHOLE POINT IS THAT A REAL WORLD APPLICATION DOESN'T CONSIST
OF LOOPS. EVEN IN YOU LITTLE C CODE EXAMPLE, THE ICACHE GETS FLUSHED (YOU CALL
```

PRINTF).

|> Do you realize how many times your CPU is asked to do string compares, copies,
|> etc. in the course of a typical execution?

It happens. Not 100% of the time though.

|> Now, if you have a fairly sophisticated algorithm, it probably won't fit into
|> a 256 byte instruction cache. That's a given. But if it is indeed composed
|> of smaller parts that DO (like string compares... etc...) you will find that
|> those sub-parts are speed up tremendously!

True, but there's a lot of code wich won't be loops. And then remember
that the machine has interrupts, etc.

|>
|>
|> > And you know what? NO MATTER HOW MUCH ATARI PEOPLE ARGUE ABOUT THIS

|> >
|>
|>
|> I never said the original benchmarks were accurate for real world apps....

Well, in that case the assumption that a lot of people are making
of a Falcon being faster than an A1200 because those benchmarks looked
cool IS WRONG!

|> only that in optimal circumstances a stock Falcon does perform much better
|> than expected (and actually beats the A1200 handily with no FastRAM.

In very very optimal circumstances. Actually, they are so optimal
that they are not even real. Those benchmark fit in both caches entirely!
Yeah, this happens every day... NOT!

I was wrong. It is more around 20% to 28%.

|>
|> (How do you measure something as exact as 12% in real world applications ..
|> using a clock?)

Using the clock tool. I was wrong in my estimate but as you my read
in my new posting 'Falcon Benchmark Nonse' (or something like that),
I made operations that take long enough to measure well enough with a
normal clock with seconds.

True. If the 68030 cache was 16k, we would be seeing a very different
story :-)

Ricardo's posting of benchmarks proves one nice thing... there is no way to compare the "real world" speed of the machines. Where are we going to find identical packages for 3-D rendering in a variety of resolutions?

I'm still waiting for some people who own the machines to try the GNU C benchmarks.

The ST (and Falcon) Blitter can do logical ops. So that's that. In fact,
if you check, you'll find that most accelerated SVGA cards have similar
capabilities.

Actually, i just gave both a good and a bad example. :)

The actual for loop, when assembled, will fit in the cache but the printf()
call goes outside and it exceeds the size of the cache.

But guess what?

Inside of printf() itself there are loops! :) much smaller ones!

i.e., my point is... the larger algorithms are composed of smaller loops which can fit in that tiny cache in *some* (definitely not all!) circumstances.

When that happens, life is good for the Falcon owner.

THAT IS MY WHOLE POINT!

>|> Ricardo, GET THEE TO A DISASSEMBLER and tell me what new method we have

Ricardo, look at a typical C function call. Take a look in stdio.h or in your system ROMs. Perhaps look at the code for AmigaDOS with a disassembler.

Your problem is you are not looking at the smaller scales and are thinking in a high level language. :)

>|> Do you realize how many times your CPU is asked to do string compares, copies,
>|> etc. in the course of a typical execution?
>
> It happens. Not 100% of the time though.
>

Oh come on. I bet you those little dinky routines like strcpy() and strcmp() and such from the famous <string.h> file are used all over the place. How do you think the text gets placed in dialog boxes? does it just mystically appear? Anytime you look at your screen at a field of data that has to be updated, there is a string function which is *tiny* being used, more likely than not... even if it was a custom job by the programmer, the principle and theory is the same.

And who is going to write a big piece of code to do simple things like that just to break a 256-byte instruction cache?

>|> Now, if you have a fairly sophisticated algorithm, it probably won't fit into

Interrupt routines are meant to be run fast, and my guess is most of them
run in a linear fashion and don't loop. However, for some, especially those
that parse bytes re: I/O, loops have to get used.

My claim is that I think, giving 5-10% or so, the Falcon and A1200 are about
equal out of the box for general purpose uses that don't use the DSP or
intense I/O.

<which would favor the Falcon, most likely...>

>|> only that in optimal circumstances a stock Falcon does perform much better

>Yeah, this happens every day... NOT!
>

I'm not saying this happens for a majority of loops in a majority of apps
even, but I am saying it happens a significant number of times in cases
where the speed increase would help out. In terms of the larger algorithms,
it'd be ludicrous to believe it would cache an entire loop in, say, a 3D
rendering package.. but it can cache a loop inside that rendering engine
that does a series of pointer ops.

Flip, my whole point is the cache benefit on the '030 chip. Looking at what
happened when the cache of the Falcon went to off, it is obvious that the
16-bit data path is crippling the machine. In the case when moving memory
of animation, animating objects in games, etc. those '030 caches on the Falcon
will not be of the huge benefit that the first benchmarks implied.

Flip, I know that. The problem is that the Atari ST (and Falcon) Blitters
can do a source & destination-> destination type of operation where as the
Amiga can do a source1 & source2 -> destination. This saves from 2 to 3 blitter
operations you'll do on the Ataris.

|> > This would happen in games with backgrounds too.
|>
|> Since when did I say we were playing games as a benchmark of performance? :)

Never, but then a game is a 'real world application.' Games are not bad, and
as I pointed out this happens in other 'serious' situations.

Event driven != looping inside a cache. When you dispatch an event, you have to
jump SOMEWHERE else to do something. While I am not an expert on the AmigaOS, I know
Motif, and I know how 'the callback game' works.

|> >|> Either a program HAS a loop or it unrolls the loop. Period. What else can

True *IF* we are looping. And BTW, those benchmarks where in the data cache,
something that is different.

Ah, but inside those loops, the machine is jumping around again. Some calls have to
go to the OS and then return, etc. Guess (again) what happens in the instruction cache?

|> i.e., my point is... the larger algorithms are composed of smaller loops which
|> can fit in that tiny cache in *some* (definitely not all!) circumstances.

Not exactly necessary. Your printf explanation doesn't cut it. The cache helps,
no doubt, but it isn't like the great 102.xx% improvement. I showed it.

|> When that happens, life is good for the Falcon owner.

Which is never NEAR as often as you imply.

|>
|> THAT IS MY WHOLE POINT!

AND THAT WAS MY WHOLE POINT TOO! :-)

There's no way you can convince me Flip... I checked out my '030 applications.
And even following your theories, you still don't explain the jumps in the printf routines (wich according to you are composed of small loops), and interrupts that occur (VBLANK) and MultiTos... (unless MultiTos isn't preemptive... hmmmmmmm.. :-) )

|>
|>
|> >|> Ricardo, GET THEE TO A DISASSEMBLER and tell me what new method we have

|>
|> Your problem is you are not looking at the smaller scales and are thinking in
|> a high level language. :)

No, doubtfull. I know assembly too, and while you have loops, you are jumping in and out. So if your printf is composed of smaller loops THAT ARE called from your C program, you are flushing the cache everytime you call printf. Then inside the 'little' printf loops you flush
the cache everytime you need access to an OS call to print to the screen. So the little jumps
inside printf execute X times the number inside printf TIMES the outer loop.

The Cache helps, but not as you think. AGAIN, I HAVE SHOWN IT. 'nuff said.

|> >|> Do you realize how many times your CPU is asked to do string compares, copies,
|> >|> etc. in the course of a typical execution?
|> >

|> >
|>
|> Oh come on. I bet you those little dinky routines like strcpy() and
|> strcmp() and such from the famous <string.h> file are used all over the place.

They are used, but not as often as you imply. In fact, I am writing C programs
right now and most of the time in what I am doing I don't deal with strings!

You know, programs aren't strings all the time! (Unless you are talking
about Lisp :-) )

|> How do you think the text gets placed in dialog boxes? does it just mystically
|> appear?

How do you think the dialog box get's placed on the screen? Do you think
strcpy() or strcmp() do it for you? >>> NO <<<

How do you think the character text gets drawn on the screen? Do you think
strcpy() does it for you? >>> NO <<<

You might have a loop reading through the character string, and then a call
to the OS for writing a character... and the ICACHE gets flushed.

|> Anytime you look at your screen at a field of data that has to be
|> updated, there is a string function which is *tiny* being used, more likely
|> than not... even if it was a custom job by the programmer, the principle and

Just because you strcpy() it, it doesn't mean that it updates the screen.

|> And who is going to write a big piece of code to do simple things like that
|> just to break a 256-byte instruction cache?

Nobody, but again, is not necessarily because of the size, but because jumping
around.

|> >|> Now, if you have a fairly sophisticated algorithm, it probably won't fit into

Ah, but my dear friend, interrupts are INTERRUPTING your great looping program.
Guess what: CACHE FLUSH TIME!

|> >|> > And you know what? NO MATTER HOW MUCH ATARI PEOPLE ARGUE ABOUT THIS

Well, I think if I remember the figures properly that not even with 22% it
becomes better than the A1200... And this is an A1200 with No FastRam....

|> <which would favor the Falcon, most likely...>

I/O wise and DSP wise, true, the Falcon should have the edge (in I/O the exception
is if you expand the A1200, which I can justify since the Falcon costs more).

|> >|> only that in optimal circumstances a stock Falcon does perform much better

Well, explain better then. Looks like you are implying that those benchmarks
are valid, WICH IS MY WHOLE POINT: THEY ARE NOT.

|> In terms of the larger algorithms,
|> it'd be ludicrous to believe it would cache an entire loop in, say, a 3D
|> rendering package.. but it can cache a loop inside that rendering engine

Like a demo :-) There, that's a 'REAL WORLD APPLICATION'... right? :-)

FOOD FOR THOUGHT FLIP:

GUESS HOW THE CACHES FILL FROM MEMORY? Ah, 16-bits at a time I guess...
That means that the '030 caches on the Falcon could be even MORE efficient
in theory, but under some situations they might not benefit the Falcon
in a couple of cycles...

Food for thought.

|>

Why don't do the following:

An Atarian with a Falcon look for a program that can do some CPU processing
that takes some time that involves no I/O. Image Processing, or SpreadSheet, etc.

Turn off the cache and do an operation that takes at least 30 seconds. Measure it.
Turn on back the cache and measure again. Post the numbers. This should give
the % of improvement of a real-world Falcon app of the benchmark. Then in turn
we can apply that number to the Falcon Benchmark numbers.

The A1200 number will have to be adjusted too, so an A1200 owner will have to do
exactly the same (another owner, I got a lot of stuff to do at the moment, and I don't
want to open my machine to take off the accelerator that I have just for this).

Run an application with and without the '020 cache enabled. Post the numbers.
Then the A1200 benchmark test will have to be run again but without the ICACHE
enabled.

Having the above %'s, we can adjust the original benchmark numbers if they are
timed using all caches disabled on both machines.

Enjoy.

The DSP may be a general purpose processor, but it requires _highly_
specialized programs to be of any use. It's certainly not going to make
PageStream or gcc run any faster.

The Mandlebrot demo shows exactly what I've always though; that the DSP
is useful for a _few_ specialized appliations, written _expressly_ to
use the DSP, but it's of _no_ use for normal programs (if it was, the
Falcon's NewDesk might've made use of it).

> OS/2 (short for "Operating System/Two") is a Disc Operating System

> TOS (short for "The Operating System) contains a Disc Operating
> System (DOS) called GEMDOS. It is not MS-DOS, although it uses
> MS-DOS file formats.

It's not a DOS though; you can boot with no disks at all and even run
programs (off cartridges).

Is unix DOS? Is the Mac System DOS? Nope. Oddly enough, they can both
use disks. This sub-thread is useless semantics (and them's fightin'
words coming from a semiotician! :-)...

> Are you asking for a prediction? Predictions are easy to make!
> However, I don't know of anyone working on a ray tracer that makes
> use of the Falcon's specific hardware. And anyone who is working
> on such a project probably has a Non Disclosure Agreement keeping
> their mouth shut and their fingers occupied.

And keeping people from plunking down too much money for an underpowered
Falcon030.

> C bindings for the DSP are being discussed in other threads, and
> it probably won't be long until such support will be available in

> high level languages like Basic.

But WHAT are you going to use the DSP for? Drawing windows faster?
Nope. It's not even that useful for rotating sprites and whatnot (that
thread's going on in the Jaguar discussion, I think); a faster CPU
and/or an FPU would be more useful there.

> >Unfortunately, there is no easy way to develop for the Falcon and get
> >any speed out of the machine. The DSP has to be programmed in
> >assembler, and most developers use C and/or C++.
>
> (See previous paragraph)

C bindings for the DSP won't be useful; an entire _routine_ has to be in
DSP code or it's useless. Now, if someone built a library of DSP
routines that could be linked by a real language's compiler, it'd be
useful (ex, BrainStorm's fast JPEG loading routines).

> Compatibility is important! Ask any user of the MS-DOS machines! :-)
> Regarding the current dearth of Falcon-specific software, let me repeat:
>
> >> Good software takes time.

Compatibility also cripples machines, and software, _any_ software,
should't take over a year to appear.

> But just this last weekend, Atari was present with a booth at the
> San Diego Computer Fair demonstrating Falcons to an estimated
> 20,000 attendees.
>
> There were no Jaguars to be seen.

Because the only actual units that aren't locked away in Atari HQ are in
the hands of busy developers; Atari can't show a machine until they
officially announce (or 'release' in Atari-ease) it or they'll be
laughed out of existance by everyone who's been stung by their vaporware
announcements before.

> Nope, the facts don't support you here, because Atari is still
> actively showing and selling the Falcon.

Only because they have nothing else to show. And I certianly wouldn't
call anything Atari does 'actively supporting'; the SD Computer Fair was
probably put on exclusively by user's groups and dealers.

> And when the Jaguar is a massive success (here's hopin'!), they'll
> have a large marketing budget for the Falcon. And the Lynx. And
> the TT. And whatever projects they've got under development now.

Not that they'd bother with computers at that point; they'll know they
can make some money (for once!) by selling consoles.

> With limited resources, they have to pick and choose carefully.
> As they grow, they might just surprise you with new stuff and
> support for the existing lines.

That's a good one. Really.

When Atari released the Falcon030, they bragged about how much
cash-on-hand they had for marketing. They're doing the same now for the
Jaguar, even though it's ~20 million less than they had for the Falcon.

> Sorry, I didn't mean to start a compiled-code shootout here. I was
> attempting to show that the inefficient architecture of the MS-DOS
> machines caused an expansion in executable code size when compared
> to the source code, while the efficient TOS architecture caused

My compiled-code example simply showed that your hypothesis wasn't true.
The version of Word that I use at work (5.0a) is about the size of
AtariWorks.

> "Atari vs The EXPENSIVE World Of DOS" it says in the subject line. It
> takes a $2500.00 '486 @ 66 MHz to keep up with the capabilities of

> other things. Like a week-long vacation at Disneyland/Knott's Berry
> Farm/Medieval Times.

The $1500 '486dx/33 with 4M and a 100M hard drive, PLUS the monitor, is
faster and more capable than the $1500 Falcon030/16 with 4M and a 80M
hard drive, WITHOUT the monitor. A computer is useless if you can't get
any software to make use of the 'features' that you bought it for (like
the much-touted DSP for example).

> Comparing a word processor (Microsoft Word) to a desktop publisher
> (PageStream) will certainly make the word processor look good in the
> speed department! :-) Have you tried comparing software that runs
> on both machines (Microsoft Write springs to mind)?

MS Write for the Atari is a pathetic spectacle compared to the small and
occaisionally useful Write that ships with every copy of Windows or OS/2.

> >And pretty much abandoning all the work they've put into the Falcon...
> >and the Falcon040.
>
> Nope -- see the report about the San Diego Computer Fair, noted
> above.

Which was put on by _user's_groups_ and dealers, not Atari. Atari
doesn't even lend equipment to shows.

Ricardo Hernandez Muchado writes
> Event driven != looping inside a cache. When you dispatch an event, you have to
> jump SOMEWHERE else to do something. While I am not an expert on the AmigaOS, I know
> Motif, and I know how 'the callback game' works.

Does the Amiga utilize callbacks? not every GUI uses callbacks like Motif.

Anyways, your point is taken. It doesn't imply looping within a cache, but it does imply looping. :)

> There's no way you can convince me Flip... I checked out my '030 applications.
> And even following your theories, you still don't explain the jumps in the printf routines
> (wich according to you are composed of small loops), and interrupts that occur (VBLANK) and
> MultiTos... (unless MultiTos isn't preemptive... hmmmmmmm.. :-) )

Oh come on. :) You know MultiTOS is pre-emptive. :)

Anyways, I'm not saying this is the gospel. What I am saying is that these tiny loops, unless they contain branches or get interrupted are having a fun time running.

And hey, if these interrupts are so frequent, how come the code in the benchmarks ran so fast if it could get interrupted? i'm sure the benchmarker didn't cut off his Falcon's ability to do a vblank or the 200hz timer because he had to have SOME timer going to he could time the benchmarks!

So what i'm saying is.. if all this cache flushing is going on as a result of interrupts... how could the benchmarks (which ran under TOS 4.xx on a Falcon) get such a boost from the cache? surely during their execution (some 20+ seconds!) SOME interrupts occurred. Was this just a great computer design or are you wrong? :)

> No, doubtfull. I know assembly too, and while you have loops, you are jumping in and out.
> So if your printf is composed of smaller loops THAT ARE called from your C program, you are
> flushing the cache everytime you call printf. Then inside the 'little' printf loops you flush
> the cache everytime you need access to an OS call to print to the screen. So the little jumps
> inside printf execute X times the number inside printf TIMES the outer loop.

But what I'm saying here <--- do we say this to each other a lot or what?

..is that eventually, all these branches and jumps inside these loops that allegedly flush the cache are resolved, whether by ROM OS routines or whatever. These routines ultimately, if they loop (and are called a lot) will wind up in the cache more often than not and give a boost in performance which would affect the real world performance of the machine.

I'm NOT saying this is a replacement for a 32-bit CPU<->memory bus. Or that it makes the performance of the Falcon akin to that. I am saying it increases it enough to make it comparable to an A1200, especially one with no FastRAM.

>
> The Cache helps, but not as you think. AGAIN, I HAVE SHOWN IT. 'nuff said.
>

'nuff said? Did you grow up on Marvel Comics, too? :)

>
> FOOD FOR THOUGHT FLIP:
>
> GUESS HOW THE CACHES FILL FROM MEMORY? Ah, 16-bits at a time I guess...
> That means that the '030 caches on the Falcon could be even MORE efficient
> in theory, but under some situations they might not benefit the Falcon
> in a couple of cycles...

Well, if the cache is filled 16-bits at a time and it is constantly getting flushed by interrupts as you say... then the 16-bit bus on the Falcon sure didn't cripple it during the benchmarks because:

1) some interrupts surely occurred during program execution. VBLs occurred at LEAST 50/second.

2) if the cache gets flushed and get this 16-bit buss performance hit, then when we had these VBL, 200hz timer ticks, etc... happening, the Falcon should have slowed to a crawl. Instead it outran the A1200 by almost a factor of 2, right?

The benchmarks ARE biased towards an '030 machine as opposed to an '020. That's a given. But while I don't think they reflect the results of running a typical real-world application, I would say that it does show that Falcon is NOT the dog you think it is.

Clones are not the reason IBM has been having, along with many other high
tech firms, finacial restructuring problems. In fact their "PC" division
is doing fine, especially since it achieved freedom. There are many reasons
for IBM's "problems". PC's are not high on the list. Shift away from
mainframe growth, etc...counts far more. Slow start in the workstation
market. You name it.

Cross-posted to: comp.sys.atari.advocacy,comp.sys.amiga.advocacy

Comparison of a 1200 and a falcon can only be usefull when we have high
quality benchmarks that run on both machines. This kind of benchmarks
are not easy to write and it takes serious knowledge of both machines. So
writing small machine language programs that measure memory performance and
the like, is absolutely meaningless. There is also no point in measuring
both systems with common compilers like gcc, because as I said above the problem
is to write a benchmark which measures the real-life performance of both
systems.
So, here comes the suggestion:
If we can't write the benchmarks (and believe me we can't in a reasonable
amount of time), we can always run on both machines the SAME applications under
a common operating system!! (yes, i mean the mac emulator, or the atari
emulator if it can run). So, let's test the performance of a few MAC apps
under our MAC emulators!!
Of course this is a case which needs some thinking:
1. The MACOS should be able to take advantage of the 32bit CPUs we have.
2. The emulator itself should not provide much overhead to the CPU. In other
words the emulation code should not eat much CPU!

I can give an answer to the second question. The AMAX emulator for the Amiga
does not eat much CPU for the emulation itself and so it can be used for
benchmark purposes. The question is still hanging for you Falconers... Do you
think that you MAC emulator is appropriate for such a comparison? Frankly
I can't find a reason why it shouldn't.
I can't give an answer to the first question, but I think system 7.0.1 and
above is appropriate for running our applications on, because it runs on
the speedier Macintoshes (quadras). If someone knows more about Macs OS
he should inform us.
So what do you think about that? I really think its the most affordable
and error-free solution!

Spiros Papageorgiou

>

Okay, I did the following with a program that loads in and displays picture
files. It does do I/O, but I don't see what difference that makes. I used
this program because it very nicely reports the processing time when it
has displayed the picture. I ran it under Multi-TOS since it provides the
menu command to turn the caches on or off. I am not sure which cache this
affects, so I am assuming it is both. I don't have anything else to give
accurate times on, but I will keep looking.

424x480 JPEG loaded into ~800x600 16 color screen mode:

With out caches - 174.5 secs
With caches - 119.5 secs
-----
55.0 secs faster with caches

If my math is correct this means the caches in real world applications
should give ~30% improvement. I would expect that some things (like
archivers) run more in a loop and improvement would be better.

I think this confirms what was posted by Ricardo as far as real world
improvements that could be seen by using a cache.

Note, I also think that it means that the 16 bit access in the Falcon
does not play a part when comes to the caches. We see the same improvement
with caches on a 32-bit system and on a 16-bit system.

RandyH

[stuff deleted]

Here are some preliminary numbers I got by running an image display
program with cache on/off:

Setup: 16 colors, Multitos running, Running Gemview loading a large GIF.
Cache on:
1 min. 32 sec.
Cache off:
2 min. 20 sec.

Setup: same as above, 256 colors
Cache on:
2 min. 2 sec.
Cache off:
2 min. 52 sec.

As I said, this was run under multitos, however gemview was the only
running program apart from the desktop/accessories. I have no screen
accellerator installed.

This was timed with a lowly stopwatch, but still accurate to about 2
sec. I'll try running some more tests later - I need to get a program to
turn the cache off outside Multitos...

This would still have some problems: the i/o libraries for the machines,
and the i/o devices would differ. To minimize this, the files could
be very large. A better test would be to use a non i/o bound program,
such as a ray tracer.

I own KCS OMEGA and can safely say it is a decent sequencer, but hey, let's
face it... the Amiga doesn't even have OMEGA (which I currently use on the
Atari) and it is nowhere near as good as Cubase.

>: This is about as ludicrous as me saying that just because the ST line has

>

In what reviews? Amiga magazine reviews? Heck, by that standard, the Atari
Falcon 030 is the best multimedia computer... according to reviews.

(in Atari magazines)

:)

That's because the 1200 can't run gnu c out of the box. And despite
the much ballyhoo'ed expandability of the 1200, it seems few people
actually do expand the thing.

According to a programmer here in Sweden (Blade/New Core I think), the 16- bit crippling is hardly noticeable when doing benchmarks to test it. He wrote a textfile about various things where he included such a test. (No figures though)

I still don't beleive there's absolutely no reason why the bus in the Falcon is 16-bit. (Atari claims it's much faster than a normal 16-bit bus, smoe say it's more like 24 bit, and some (like me) would claim it's running on 32Mhz)

Noone knows, and I guess it'll take a techie to find out.

(My 16Mhz Falcon030 is WAY faster than my 16Mhz (with 32Kb cache) 68000 STE)

This is just little nit-picky stuff, but for the sake of completeness...

khaley@nova.gmi.edu (Kevin Haley) writes:

>Atari was founded by Nolan Bushnell in 1972 with the invention of PONG, the
>first computer video game. Shortly thereafter, Bushnell sold Atari to
>Warner Communications (before the Time Warner merge).

I don't think the sale to Warner came quite this early. I think Atari was already a well-established force in the coin-op and home game markets (remember TV Pong?) before Warner offered to buy Bushnell out. My guess would be '77 or '78.

>Warner Communications pushed Atari to develop the video game. After the PC
>came to market in 1978 (I believe), Atari inc. developed the 8bit Atari
>400/800 computers. This line was extremely successful in the early personal
>computing market, finding its way to several schools (yes, schools!) in
>California, Michigan, and Illinois.

The IBM PC was not introduced until late 1981/early '82. The Atari 400 and 800 were developed in response to the unprecedented success of the Apple ][ (which is why they look so much alike) and capitalize on Atari's growing name recognition.

>Meanwhile, the Atari coin-op and 2600 video game market boomed in the early
>1980's. Atari became a huge money-maker for Warner, dominating the video
>game market and a potent force in the PC market. However, a slump around
>1984 dragged down Atari and several computer companies went out of business
>(Timex/Sinclair, Osborne, Adam, etc). Warner Communications sold Atari to
>the Tramiels for $350 million (I think).

Sinclair was a small company which Timex bought under the foolish delusion that there would be a widespread consumer market for what was essentially a hacker's machine (the original Sinclair was a build-it-yourself kit). Adam (a colossal failure by anybody's standards) was an allegedly Apple ][-compatible machine developed by the toy company Coleco (which is why the Adam looked like a ColecoVision game system with a paint job). Coleco took several more years to go bankrupt, despite the inexplicable raging success of their Cabbage Patch Dolls.

>Under Tramiel, Atari developed the ST, which was released in 1986. In the
>beginning, it was an instant success, and was the major factor bringing
>Atari back to profitability. With the revival of the video game market,
>Atari developed the XE game system (I remember TV was bombarded with
>commercials regarding this system in 87), and in the late 80's, the
>portable Lynx. As Atari developed other systems (the TT, Portfolio, Falcon,
>and now the Jaguar), the prominence of IBM compatible computers edged out

>the Atari market. This is where Atari is today. Struggling to keep PC's on
>the market and create a popular game system.

I believe Tramiel was merely CEO under Warner for a while before buying
the company outright. Note that Tramiel was sought for the position
because he was generally credited with transforming Commodore from a
third-rate calculator company to a major player in the (then-extant) home
computer market.

>I was a loyal Atari follower for many years, and knew a large number of
>Atari computer users in my area. It is my sincere wish that development for
>the Jaguar succeed, so I can see an Atari prominence that I so fondly
>remember in the early days of the computer/video game system.

Is this possible??
If your programm usese 50% of the time with I/O your improvement caused
by caches is only half the size! Caches don't improve I/O perfomance.

>this program because it very nicely reports the processing time when it
>has displayed the picture. I ran it under Multi-TOS since it provides the
>menu command to turn the caches on or off. I am not sure which cache this
>affects, so I am assuming it is both. I don't have anything else to give
>accurate times on, but I will keep looking.

I think you are refering to GEMView. I have tested this program too a few
months ahead.
I have also tested some other applications without Harddisk I/O. These
programms like TEX or the GFA-Compiler needed half the time with caches
on. That means full 100% improvement.
I don't think you are suggesting that TEX is too small...

Don't confuse the facts. Atari NEVER had the resources to do wafer fabrication. There is no reason for them to fab their own processors/chips. It costs about $400M to start a fabrication facility. That would be money poorly spent.

There was great fun and frolic in the article from
<H.eg.2a4g31QTeA_@semprini.tdkcs.waterloo.on.ca>
cherborth@semprini.tdkcs.waterloo.on.ca in which is written:
>If Windows did pre-emptive multitasking, single applications wouldn't be
>able to hog the system so easily. Also, when you install Windows, it
>doesn't multitask DOS programs _at_all_, you have to change the default
>settings to get that to work.

I believe he's agreeing with my comment that Microsoft Windows
doesn't perform pre-emptive multitasking. Or maybe not.

>> True, there is a standard operating system that ships with *every*
>> Atari. It's also true that you can get alternate operating systems
>> (OS-9 springs to mind) that will run on the Atari. I see discussions
>> of alternate file systems on other threads in this and other Atari
>> groups, so I can assume there are a few more....
>
>The alternate filesystem thread has almost nothing to do with operating
>systems; it's about MiNT (which isn't a complete OS, since it relies on
>the underlying TOS to get its work done).

I believe he's agreeing with me again, both on the subject of
alternate file systems (minix is the topic of discussion, I
believe) and alternate operating systems such as OS-9. Is
there some technical wizard that can provide an authoritative
posting on alternate file systems and alternate operating
systems available on the Atari?

And his comment about MiNT seems correct (from what I've seen
of MiNT, anyway): it's a shell over the operating system,
in much the same way that Windows is a shell over MS-DOS.

>> >Atari has been "rebuilding" its dealer network for the past seven years.
>>
>> Persistant, aren't they?
>
>More like 'stupid', IMHO. The number of dealers just keeps shrinking.
>You really can't call music shops 'dealers', since probably 99% of them
>have no clue about computers, they just know that the Atari machines
>have MIDI ports already, and a few good software packages.

Having quizzed the sales people at the local Computer City and CompUSA
regarding their product on display, I can state without fear of rebuttal
that the music store dealers adhere to the same high standards of
knowledge and performance as the computer merchants. :-)

[ My Comments Relating To Atari's Marketing Effort Deleted ]
>Hahahahahaha....
>Hahahahahaha...

>Atari's _needs_ to be held up by its dealers or it would've died
>completely in the past four years.

If you're saying that the dealers need to sell the product,
you're right! (We seem to be agreeing a lot these days!)

>But still no hardware for them to sell, and no one to sell it to because
>the Falcon is not competitive with _anything_ else on the market.

Not in massive quantities ... yet ... and Atari is being cautious
because the overall market for computers is depressed, for now.
Apple's had to slash prices, IBM's had to lay off workers and
experienced an embarrasing decline in stock price from $120/share
to $40/share, and Commodore ... well they're still in there trying!
This is not the sort of market that encourages a "giant leap forward".

Not competitive? It takes a '486 @ 66 MHz MS-DOS machine to keep up
with a 68030 @ 16 MHz Falcon, and it's the *Falcon* that's not
competitive???? <incredulous look> One needs to spend a thousand
dollars _more_ just to get the same performance as a Falcon, yet
the *other* machine is 'competitive'? <even more incredulous look>
And knowing that the rate of change will make the 'other' machine
obsolete in about three years is more competitive than a machine that
remained usable and productive for eight years? <thoroughly
incredulous look>

I don't think so. The MS-DOS machines appear to be the ones that
are 'not competitive'.

>> >The Jaguar was brought up because Atari has virtually abandoned the Falcon
>> >already, putting (according to Bob Brodie, just to satisfy Warwick's
>> >curiosity) all its resources ($35 million, down from the $50 million
>> >they said they had to launch the Falcon) toward launching the Jaguar.
>>
>> It that were true, they wouldn't have been at the San Diego Computer
>> Fair, actively demonstrating only the Falcon!
>
>Yes it would, because they _can't_ demo the Jaguar yet, so the Falcon is
>their only potential source of income right now. They certainly haven't
>been demoing a more powerful Falcon anywhere, now have they?

You're right, they _can't_ demo the Jaguar yet. But if Atari was
using "all its resources ($35 million, down from the $50 million they
said they had to launch the Falcon) toward launching the Jaguar",
then they would *not* have been at the show at all. My point: Atari
is still actively marketing the Falcon.

In another response, I've copied a question posed to Bob Brodie of
Atari and his answer relating to future Falcons. In short, Bob says
there will be more of them coming down the road.

>RAM size for multitasking (and doing some more complex work with G++): 8
>megs. That's how much RAM you want on a Windoze or OS/2 system, too.

The three standard RAM sizes are 1 Megabyte, 4 Megabytes, and 14
Megabytes for a Falcon from Atari. Third-party add-on boards can
take that level up to 256 Megabytes of (fast!) TT-RAM. Another
poster noted that 4 Megabytes of Falcon RAM 'isn't quite enough':
you're correct that a lot of RAM is needed. If RAM weren't so
doggone expensive due to the Niihama explosion/fire, you'd probably
be seeing more 14 Megabyte Falcon's.

Windoze NT specifies 12 Megabytes of RAM as a minimum (it says so,
right on the box). It's my understanding that OS/2 runs 'just fine'
in 8 Megabytes: you're correct on this one.

I don't think so. There's a lot of people already expanding
their A1200 to a 25Mhz '030 at least because it's really cheap to do so
(relatively speaking).

That's only natural. You are comparing a 68030 vs a 68000.

|>
|> <so what's happening?>

Well, for that ask Heiko. But I admit VBLANK is not as much as
a problem as jumping around in the programs' code (in a real-world application).

|> So what i'm saying is.. if all this cache flushing is going on as a result of
|> interrupts... how could the benchmarks (which ran under TOS 4.xx on a Falcon)
|> get such a boost from the cache?

Could it be because of the Falcon's 16-bit access and the size
of the benchmarks?

Yes, I admit it, the interrupts would not play a big role as jumping
around in code, calling OS subroutines and multitasking with other programs.

|> surely during their execution (some 20+
|> seconds!) SOME interrupts occurred. Was this just a great computer design or
|> are you wrong? :)

Actually, it might show a poor computer design.

Think about what you are saying. If you have an outer loop that inside
contains tiny ones, you are flushing the cache quite a lot.

|> I'm NOT saying this is a replacement for a 32-bit CPU<->memory bus. Or that
|> it makes the performance of the Falcon akin to that. I am saying it increases

Hmmm... if you are again thinking from the data obtained from those
benchmarks, kiss it good bye. NO MATTER HOW MUCH YOU GUYS TALK ABOUT
THIS IMPROVEMENT, THIS IS WRONG. I SHOWED IT WITH MY OWN '030.

|> should have slowed to a crawl. Instead it outran the A1200 by almost a
|> factor of 2, right?

No, that isn't true. It outran ITSELF by a factor of two (the Falcon), but
not the A1200.

|> The benchmarks ARE biased towards an '030 machine as opposed to an '020.
|> That's a given.

They are biased toward both chips. Is even more towards a 68030 and
to the Falcon because of the 16-bit data path of the Falcon.

|> But while I don't think they reflect the results of running a
|> typical real-world application, I would say that it does show that Falcon is
|> NOT the dog you think it is.

Totally opposite. You don't get 102.xx% improvement on the '30
caches, I SHOWED IT. This means that instead of using your biased result
of the Falcon, improve the time it took without the cache by 30%
and you'll see that it takes even longer or around the same as an A1200.

An A1200 with FastRam will surely be even faster.

If your program doesn't count the I/O time as processing time, it
shouldn't matter. One suggestion, put your image on the RamDisk and load
from there.

|> I used
|> this program because it very nicely reports the processing time when it

|> archivers) run more in a loop and improvement would be better.

That sounds about right. On some programs you can expect a tad more
improvement (particularly compression/small programs). On others a
bit less, like 20->25%.

|> I think this confirms what was posted by Ricardo as far as real world
|> improvements that could be seen by using a cache.

Yep. A 68030 is a 68030 is a 68030 is a 68030 :-)

|> Note, I also think that it means that the 16 bit access in the Falcon
|> does not play a part when comes to the caches. We see the same improvement
|> with caches on a 32-bit system and on a 16-bit system.

Don't jump to conclusions so quicly. Remember my tests? I didn't get
30% on the average. On the 'huge applications' I got 17% with the exception
of Scenery Animator.

The bigger the program you run on the Falcon, the more negligible
the difference between the 16-bit '030 on the Falcon with caches
and without caches enabled becomes.

Anyway, my point is divide now the first number that the Falcon
got on the first benchmark by 1.3 (30% improvement) and I think that
even the A1200 without FastRam is a tad faster.

That doesn't sound right. Sorry to be skeptic, but while I would expect a Falcon to have a higher percent of improvement (thanks to its crippled data path) 100% is way to high.

Okay, silly me. I see the your point about I/O and yes it does make a
difference. How much I am not sure. GEMView does spend a lot of its
time loading in the picture file so perhaps the improvement possible
from the caches is far less with GEMView than with other types of
applications like archivers and compilers.

I in fact my test showed the low end of possible improvement with the
cache, then perhaps someone could post a real world test of something
that does not do much if any I/O and we could see what the high end
would be.

# 1985. Jaguar questions

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-20 21:09:18 UTC
From: khaley@nova.gmi.edu
Message-ID: <khaley.748559358@nova>
Source record: 21269

I have some questions regarding the Jaguar. If anyone can answer these questions with some confidence that would be greatly appreciated.

1. Many people have said that the Jaguar can support Virtual Reality. In fact, in the Gamepro magazine, it is said that an expansion port will enable hookup to a VR interface, and a VR helmet may be released in the spring of next year. Would this helmet project screen images that would be as impressive as screen shots? Is there even a VR helmet to be released? Please comment.

2. Will the Jaguar support superVGA monitors? Will we have to buy a specially dedicated monitor? Or do we need some sort of interface for monitors?

3. For anyone who has actually seen a Jaguar in action, how impressive is it? What is the potential?

I know 17 people who will buy a Jaguar in a heartbeat if some sort of VR device for it is in the works (especially after seeing the impressive screen shots). And this is only among the people I know!

Thanks in advance for any answers or comments.

*sigh* Same old debate. The point being that all this is ****EXTRA****.
I am talking about standard built in I/O.

SCSI on the Amiga is..... ****EXTRA****
LAN on the Amiga is ..... ****EXTRA****

and so on.

Yes, the Amiga basic I/O configuration is just about equal to your average
(also pathetic) IBM compatable. The Falcon has a much more comprehensive
list of features.

Now repeat after me....Xavier is talking about *standard* features, not add ons.
Now repeat after me....Xavier is talking about *standard* features, not add ons.

Let's get this straight.

200,000 A1200s sold since the release... probably more. "It's NOT just a
game machine", but....

...they still can't run GNU C?

Well, I hate to break the news to you, but if 200,000 Amiga 1200 users can't
seem to port GNU C and this tiny group of ST/TT/Falcon owners can, then that
seems to imply that Amiga 1200 owners don't seem too interesting in programming.

(at least, not in programming in a UNIX-like manner... GNU C is best fo that...)

>Most A1200 go for a better freely available package instead of GNU C.
>

Really? And what package is this? (I'm not saying GNU C is the best, but
their compiler does a hell of a job on optimizing and the GNU project has
been at this longer than most people who write one in their spare time...
most homebrew compilers can beat it in compile speed, others in terms of
optimizations, but few can offer the options of GNU's)

>I guess the Falcon owners have to roll their own, as nobody is writing
>software for them...
>

Hmmm. Ok, you say Amiga has SAS/C, Matt Dillon C and GNU C.

The ST has HSC, Pure C (formerly Turbo C, that nice package from Borland), GNU C, and the latest version of Lattice C.

In the C compiler war, looks like the Amiga is lacking ammunition. :)

Indeed. In fact, GNU C has builtin code in the compiler to implement
these routines!

> With out caches - 174.5 secs
> With caches - 119.5 secs
> -----
> 55.0 secs faster with caches

>If my math is correct this means the caches in real world applications
>should give ~30% improvement.

x + y% = x + x*y/100

119.5 + 30% = 155.35
119.5 + 46% = 174.47

* * * *
Therefore, the caches sped up the real-world calculation by about * 50% *
* * * *

On the TT, which doesn't have a blitter, the perceived difference is IMMENSE.

BTW,

x - y% = x - x*y/100

174.5 - 30% = 122.15 approx= 119.5, ie. it is 30% slower without caching.

Peter, you are one serious stupid moron. Geez, man. You're really screwed
up this time.

I was saying that DESPITE the fact that there are 200,000 new Amiga owners,
they still can't manage to get GNU C up and running on their most recent

OS while these "dead" Atari owners have been busy with Mint mailing lists, etc... to make sure we get the latest updates WHILE ALSO SUPPORTING COMMERCIAL C COMPILERS!

Now what you've done is given me an excuse to flame the Mac. :)

In fact, let's talk abotu these Centris 610s. They are nice machines. I've played with them. But the Amiga owners are right...

Mac multitasking is a joke!

Here's why the Mac is dead:

1) Windows 3.1.
2) OS/2 2.1
3) Windows NT

I'll go so far as to mention Solaris and NeXTStep.

See, the catch is, Peter, the HARDWARE is where Apple's money is. If they port the Mac environment to PC hardware, no one will care because they will already have a more established OS to go with for Intel processors. The software out now wouldn't run on 80x86 machines without suffering severe performance penalties that "fat binaries" from NeXTStep get around, and which are totally avoidable when the native environment for the OS is intel-based.

So we have Apple cutting prices to sell their hardware. And not doing a very good job of it because the clones are beating them in total sales. Sure Pete, Apple looks good as an individual computer manufacturer, but what good is it to be large but still have no market share?

Commodore and Atari looked at the business computer market and (i think) made a hasty retreat. They know they can't compete.

Apple's doom is that they are unable to retreat because their operating system and applications have tied them to the business computer market and when they can no longer be a force in that area, they are going to die.

It won't happen tomorrow. It probably will take about 5-10 years before it becomes noticeable, but... while some see Newton as Apple trying to stay innovative, I see it as the move of a company realizing they better find a new market to exploit because they can't compete with the clones in their original market.

So, sure, Apple hard/software will be around years after the ST and Amiga stuff is gone... but don't give me any of your talk about how Apple is the solution.

I wonder what my Atari makes it? :)

Anyways, Peter... I've got friends at Iowa State, and I think perhaps you should talk to them. Say hi to dnquayle@iastate.edu for me. And if you don't reply correctly, i'll hire him to kill you. :)

: That's because the 1200 can't run gnu c out of the box. And despite
: the much ballyhoo'ed expandability of the 1200, it seems few people
: actually do expand the thing.

Actually, I guess about half of the owners have gone for extra memory.
(using a very bodgey reading amiga newsgroups, in particular the hardware
groups).

2MB of chip only RAM isn't great for doing lots of serious work. 2MB of
any memory isn't really enough. I've got 5MB of RAM in an A500 and find
it "just right".

Few people run gnu c because (1) it requires gobs of memory
(2) it requires a 160KB library, something
which make distribution of binaries
difficult
(3) there are better pd/shareware alternatives

Ultimately the best benchmark would be the sales. Simply put if Falcon
is not selling .. it might as well be the NeXT. THe hardware is totaly dicontinued
as of now, and there were advicates of it being the best machine ever. Now they are hoping
to
implement it as an OS, but given very few if any can promice on developing,
it's gonna be getting nowere.

|> remained usable and productive for eight years? <thoroughly
|> incredulous look>
Even a 25Mhz 486sx will show a Falcon a clean pair of heels.
To compare, I looked at PC prices recently. 486sx25, 170Mb HD, 4Mb RAM, Windows accelerator(1mb), mouse,keyboard,multisession CDROM. GBP740. falcon, 4MB 65Mb HD, keyboard, mouse GBP950. No contest.

Don't get me wrong though, I'm very pleased with my Falcon and it does pretty much all I want plus run nearly all my existing ST software collected over the last 6 years. It sure ain't value for money though!

When I first heard (here) that the CPU->Ram bus was 16 bit, I gave Atari US
a call. I spoke with one of the designers and he told me that the
difference of a 16/32 bit bus was very small. Because of the price-
difference they used the 16bit version.

THE reason that it was not a big speed-difference was that the whole bus-
system in the Falcon runs at 32MHz ........

*ahem* !
Fun game, but ***PLEASE***! stick to what the original poster was trying to
say, ie: GNU C on the A1200...

You know, I don't know why I even bother to read any of these postings any
more... ever since the Apple pushers have invaded the space.

I don't mind reading about A1200 vs Falcon, but take the Mac and stuff it
somewhere far away from me.

And yes, I have had the opportunity to work on both the A1200 and the Falcon.
Had a chance to use a Mac for a bit, after trying to use System 7 for about
5 minutes, I was close to tossing the whole machine out the closest window.

Just my $0.02 worth.

That's DICE. You are right, GNU C is a better compiler but it is a) huge
you will have problems to run it on a 2MB machine and b) not made for
_Amiga_ programs.

>The ST has HSC, Pure C (formerly Turbo C, that nice package from Borland),

There are other free compilers but you will probably tend to use the best
thing you can get.

Regards,

In article <1993Sep17.143831.34429@rchland.ibm.com> ricardo@rchland.vnet.ibm.com (Ricardo Hernandez Muchado) writes:

Some lines deleted.

> A word processor? A Spreadsheet? A ray tracer? An Image processing
>program? No way you can fit those in a 256-byte cache. Are you using

In fact an image processing program can benefit immensely from the caches. I did a couple of tests on my image processing program MGIF 4.3 (versions before 4.0 written by Bill Rosenkranz) with and without caches as well as under MiNT. MiNT is the multitasking kernel of MultiTOS.

The image used for these tests is a 300k 534x784 GIF87 file. The file is a normal digitized/quantized photo. The tests were run in 640x400x4B interlace mode, since I haven't got the money for a SVGA/MultiSync at the moment. In 640x400x16B interlace (true colour) the same tests run approx 20% slower.
(seconds)
Both caches disabled Caches enabled
Load and decode from hard disk 10.34 5.11
Map to greyscale 2.18 0.97
Rotate 15 degrees 13.77 7.69
Blur image 11.43 5.21
Median filter 81.39 41.17
Log scale 16.14 9.03
User defined convolution 22.78 12.41

All the filters are 3x3. Timing done by system 200Hz clock. The program, about 12000 lines of C + libraries, was compiled with GCC using -mshort -O2 -m68030.

As you can see the speed increase is about 2 times for all the operations. If you have to have a percentage figure, that's 50% or 100% depending on how you define "% faster".

>MultiTos? Kiss the caches good bye on a lot of occasions.

I didn't include the MiNT timings above since they were all within 2% of the single tasking ones. The locality of reference principle holds up pretty well!

I can't understand how some people can argue that caches behave badly under a multitasking operating system. Even with 100 Hz task switch you have 160.000 clock cycles to work in. If you assume that every instruction takes 16 cycles (a very high estimate), you can still run ten thousand instructions during that time quantum. The short time needed to reload the 2*256 byte ( <= 128 instr) cache would certainly not be very noticeable.

The performance loss under MultiTOS is not caused by the multitasking kernel.
The problem is that Atari still hasn't rewritten the AES, screen manager etc
to be fully interrupt driven and not run in supervisor mode all the time.
I've heard rumours that TOS 5 will change this, though.

> Have you ever heard of Vertical Blank interrupts?

See above.

More lines cut.

This is in reply to Rickard Troedsson talking about a line routine:
> Ah, a demo? Good show of a real-world application.
>
> And I guees your routine gets called from elsewhere, which again flushes
>the cache at some point. THis is not to say that the '030 doesn't benefit,
>but that it's not the way you put it.

I guess you could write the main loop of a true colour mode line routine in
10-20 instructions at most. These instructions are then executed out of the
cache for every one but the first pixel of every line drawn.

Bob Brodie, in an online interview, was quizzed about the future of Atari computers. He couldn't give any details, but noted that there *are* additional machines planned and believes that we will be "very satisified" with them.

The likelihood of Atari *remaining* in the computer market is quite high.

I agree. A Falcon ain't usable unless it has a monitor. :)

But of course, I would also say that the Falcon's applications would suffer
from less overhead and there are some good things about the Falcon (ability to
run large base of GOOD MIDI software is one for me) that make it nice.

I would also have to say that on that 486/dx33 the machine would lack
more than a few of the amenities that are on the Falcon, like the Localtalk,
DSP, SCSI-2, joystick ports (although most sell with game ports standard),
and a FAST IDE controller.

(likewise the Falcon would need about $100 added to its price to allow the
use of SIMMS in it...)

This whole computer war stuff is a matter of people saying they have found the
best tool for EVERYONE ELSE'S job. I think if a guy wants to use a Phillips
head screwdriver instead of a flat headed one, well... that's his choice.
It all depends how on he wants to screw. :)

|>

I think you are wrong here. Any program that does intense processing and/or
calculations can use the DSP to speed things up. A program like PageStream
would probably be MUCH MUCH faster if the DSP was used for Font Scaling (for
instance). Not that it is likely to be done for this particular example,
but since the DSP is STANDARD in the Falcon, then anyone who wants to make
use of it for extra power can. Sure it isn't going to happen overnight, but
more and more applications will make use of it.

If the DSP was such a so-so addition to the Falcon, then why is everyone
else trying to get machines out with DSP built in or as add-on equipment?

<stuff deleted>

|> The $1500 '486dx/33 with 4M and a 100M hard drive, PLUS the monitor, is

|> the much-touted DSP for example).
|>

I paid $1500 for my Falcon 4/80 WITH a 14" Ultra VGA monitor. I think it
compares quite nicely with the 486dx/33 you mention. Sure, there is not
nearly enough specific software written to take advantage of the Falcons
capabilities, but the machine does have better capabilities than the
486dx/33 above.

Hey, I think anyone that would argue that the Atari market isn't severly
depressed would be crazy. But I still think the machine has great potential
and it is just a matter of time before more software is written for it.
No, it will never have a library like the DOS boxes and no it will never
be accepted to the extent of the DOS boxes, but it will have some quality

software that will do as good or better than any other PC platform.

Why do so many people think that Atari has to take over the world in order for their machines to be worth anything? Face the facts - they are a small time niche market type of company that puts out product that some people just happen to prefer over any other alternative.

Flip, Sorry to tell you the following this way but I think your comment
deserves it:

DON'T BE A J*RK.

Amiga guys have ported Linux to the Amiga. If a current GNU C can't run (if that
is correct) there will surely be a version in the future that would do it.
And BTW, isn't the GNU C version you run on the Falcon the same as the ST version? (i.e. ,
```

no
Falcon specific version?).

For your information, SAS/C is the 'next generation Lattice C.'

|>
|> In the C compiler war, looks like the Amiga is lacking ammunition. :)

In the C compiler war Flip, in the Amiga you are showing ignorance. :-|

If I were going to count more C packages I'll also count Aztec C and
Manx C (they are actually the same). You can have more packages and that
doesn't necesarily means you have a better C. I guess that Borland's C
could be better than any of the Amiga/ST packages.

At least the Amiga has at least two versions of C++.

Yes Xavier but there is one problem though: you can't say computer X is
better without taking into account price.

If that's the whole thing, I'll argue that the Amiga 4000/040 is way better/faster/more
expandable than a Falcon, and it isn't obvious to compare them that way
because of the price difference.

|>
|>
|> 119.5 + 30% = 155.35
|> 119.5 + 46% = 174.47

True.

|> Therefore, the caches sped up the real-world calculation by about * 50% *

Not true. I don't know how you come up with 50% when it was 46%. Have you ever considered marketing :-) Every % counts in these cases my friend, and there could be some tests that could be less than 46%.

119.5 + 46.025105% = 175.5

Now, I would expect this because the Falcon will surely benefit more from a cache than my already 32-bit access accelerator.

Of course, NOT THE 100% originally posted.

Now, 43 secs for the original test / 1.46 = 29.452. This seems (if I remember correctly) just a tad faster than an A1200 with no FASTRAM.

Considering that the A1200 speeds up by a 1.5 factor when adding FastRAM:

31s/1.5 = 20.666667 secs. (If I remember the benchmarks results correctly).

This would seem that on NON-DSP operations, etc. the A1200 is around 40% faster than the Falcon. Again, this is *IF* the numbers I used are the ones Heiko posted, as I don't remember correctly and this is for a FAST RAM A1200.

|>
|> On the TT, which doesn't have a blitter, the perceived difference is IMMENSE.
|>
|>

```
|>
|> x - y% = x - x*y/100
|>
|> 174.5 - 30% = 122.15 approx= 119.5, ie. it is 30% slower without caching.
```

Yep, thanks for correcting the math. I assumed that the 30% was for the original posting correctly and you are right. It's 46%.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
|> just to change between black and white ..
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Rickard, enough of your HAM lies and nonsense! OK? You don't need 10 pixels.
The worst case is three, and this doesn't happen even in the old Ham if you select
16 color registers that go with the Image. In HAM8 this VERY RARELY HAPPENS.

BTW, I know a whole lot more of Amiga graphicians that *LOVE* HAM. Remember
that HAM8 is FAR MORE POWERFULL than the previous HAM mode.

|> "indistinguishable from a 24 bit screen" ... wanna place a bet?

Yes. Get someone from the street to take a look at it.

|> "half the cost of the falcon" .. sure .. without built in SCSI-II, LAN,
|> DSP56001, 308400 serial .. etc ...
|> Get real.

No, you are the one who needs to get real here. The Falcon's price
falls in the PC range, wich is really dangerous.

A souped up A1200 will also fall in that range, but you get a system
you can start working on at a very affordable price.

|>
|> GM> Oh, and the Amiga provides a FULL 24 bit palette.

|> Yes, with 256 colours on screen in useful resolutions.
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
```

Rickard, Ham8 is a DARN USEFUL mode for real-time animation, multimedia,
raytraced art and paint. I am willing to bet that an average 24-bit picture in
640x400 HAM8
will look SUPERIOR to a 'True Color' Falcon picture.

|> GM> On what evidence do you base this theory, presented as a `fact`?
|>
|> On my knowledge since my first ST 1985.

Well, check out your knowledge. My knowledge from ATARI since 1980
is that they are used to announce products they don't ship. I had an
ATARI 600xl and an ATARI 130XE. ATARI's inferior ST and stupid management
convinced me to go with the Amiga. Of course, they could change, they
have to prove that with the Jaguar.

|> GM> C= may well try a similar trick with the Amiga _if_ the CD32 is a
|> GM> sucess. However, given the close compatibility between the Amiga and
|>
|> Cd32 a success? Talk about joking .. it's 3 years old technology already!!!

No, it's not. Although I would say the Jaguar definitively looks
better.

|> 256 colours without special gfx chips .. noone would like to develope a game on
^^^^^^^^^^^^^^^^^^^^^^^^^
absolutely false. The gfx chips on the CD-32 are special. You get the
copper, blitter, sprites and dual-playfields.

|> such a crappy piece of hardware!

Well, there are right now far more developer and titles on CD-32 that on the
Jaguar. This lack of support could indeed kill the Jaguar. Remember the Lynx?
It has flopped. Mortal Kombat is out there for the Gameboy and Game GEar, where is
it for the Lynx?

You can make an opinion Rickard, but it doesn't mean it is fact.

There's slowdown, don't talk nonsense. The benchmarks that your dear friend
Heiko posted proved it.

|>
|> GM> The A1200 is 15 % faster.
|>
|> Bullshit.

True. With FastRam I calculated it must be around 40%. Without FastRAm
the Falcon is just a tad faster, except where DSP operations are concerned.

|> GM> The A1200 has an 80 MEg HD, the Falcon a floppy (HD costs more)
|>
|> My Falcon has a 160Mb HD.

Well, my A1200 has 200 meg HD. It proves nothing.

|>
|> GM> The A1200 has 6 megs, the Falcon 1 (more memory at extra cost)
|>
|> My Falcon has 4 Megs, the A1200 I've seen are all 2 meg.

Perhaps you are a little blind then.

|> GM> The A1200 has better gfx capabilities than the Falcon
|>
|> Hahahahahahahhah.. since WHEN????

Since day 1. Dual playfields, near 24-bit capabilities IN ALL resolutions.
Sprites. Copper List. 24-bit palette.

|> GM> The A1200 has more software than the Falcon
|>
|> Geezyz ... lying again I see?
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

He's not lying Rickard. I think that this one doesn't even
has to be proven.

|> GM> The A1200 has a much wider userbase than the Falcon
|>
|> Yeah, playing games is fun. Right.

OH, let's see. When people had a lot of games on the ST they defended
the ST. Now the Falcon is 'serious' eh Rickard? Don't talk nonsense.
Playing games is fun and making serious work is too (I do both. Sorry
if you are just 'too serious').

|>
|> GM> The A1200 has a better multitasking OS than the Falcon
|>
|> Hahahahaha .. no MEMORYPROTECTION,

Is MULTI-TOS preemtpive or cooperative?

|>
|> GM> The A1200 has more peripherals than the Falcon
|>
|> Bullshit.

Not Bullshit, look around in Amiga Magazines.

|>
|> GM> The A1200 is outselling the Falcon 10:1
|>
|> According to a COMMODORE magazine in Sweden the A1200 has sol *5000* units here
|> ...

According to C= latest numbers, the A1200 has sold over 250,000 worldwide.
FAR MORE than the Falcon.

If we are going to be 'local' then the number here in Minnesota must be
*zero* or perhaps 2 or 3 Falcons. Can you be more stupid?

|> GM> The Falcon has 16-bit sound, The A1200 8-bit
|>
|> Yup.

Yes, the true Falcon Advantage.

|>
|> GM> The Falcon has a DSP, the A1200 none
|>
|> yup.

True.

|>
|> GM> The Falcon has a SCSI port, extra cost for A1200
|>
|> SCSI-II

'SCSI-II' I think someone mentioned it wasn't a 'true SCSI-II'.

|>
|> GM> The Falcon has a LAN port, extra cost for A1200
|>
|> Yup.
|>
|> GM> The Falcon has MIDI ports, extra cost for A1200
|>
|> Yup.

True for the above.

|>
|> GM> I think its pretty clear that, unless you are into music for which
|> GM> the Falcon is ideally suited, the A1200 clearly is the more suitable
|> GM> machine for the average user. Of course, the Falcon can do many
|> GM> things excellently, but the A1200 does them better and there is much
|> GM> better software available for it.
|>
|> The A1200 is a GAMES-MACHINE .. (cd32)

If the A1200 is a games machine, then why a lot of people are using it
for desktop video, image processing, etc.?

|>
|> GM> THATS why Amiga owners get pissed off at the constant sniping and
|> GM> misinformation from Falcon owners (many of whom are only Falcon
|> GM> wannabes).

|> you define "% faster".

Average is 97.73% in the numbers you posted. I'll trust you although
my mind tells me to be a little skeptic. But I'll trust you, since on the
operations you mentioned and like you said, you are going through a lot of
repetition. The Image Process effect I made was a ripple in the Image, wich
maybe not as repetitive.

This huge increase show how cripling is the Falcon's bus, but at the same
time how it benefits from the cache inmensely.

Taking your numbers, an A1200 with FastRam will be a tad faster. On other
application types the benchmark improvement is not as generous.

I encourage Falcon owners to do this kind of test with other applications.

Thanks for sharing that information. It shows that at least the Falcon
doesn't get under some real-world applications as crippled as I originally
thought.
|>
|> >MultiTos? Kiss the caches good bye on a lot of occasions.

Not quite. If you are calling this as a subroutine, everytime you jump
around the cache gets flushed.

>

Then again.. maybe not...

Yes, at this point, a game (normally A game) sells the system. The problem
with atari is that they give games with the systems like "We know you
wouldn't buy this game on your own, but we hope you enjoy it"
ColecoVision came with Donkey Kong, which set the trend for including a hot
and popular title with the system. ()and then ever lasting Mario spin offs)
Sega Genesis was a nice system, but they flew of the selves when Sonic was
packed with the game. But then, a good cute character in a good game doesn't
garentee anything. Turbo grafx 16 is a good case for that.

>
>

Actually, let's consider this.... The Falcon feeds its caches 16-bits at
a time. When data or instructions are in the cache, the fetches are as if
they were indeed 32-bit...

(with 0 wait states)

Now, let's look at your stock A1200 with no FastRAM BUT with 32-bit access
to chipRAM. Why does the Falcon perform at its level if there is a
(theoretical maximum) 2X increase in speed thanks to the 32-bit CPU
access to RAM?

I think ANY system would benefit from the cache. A secondary cache would
make life even more tolerable.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Are we talking now or later?

:)

In the future we will all be assimilated into the Borg.

:)

>And BTW, isn't the GNU C version you run on the Falcon the same as the ST version? (i.e. ,
no
>Falcon specific version?).
>

Depends... the major factor is whether the person posting built it for the 68k
or not. Add a flag to say -Dm68030 and bang... you have a 68030 version. :)

>
> Borland does it?
>

Borland *did* do Pure C....

>|> GNU C, and the latest version of Lattice C.
>
> For your information, SAS/C is the 'next generation Lattice C.'

So is Lattice C 5.6. :) What's your point? Is SAS/C a Lattice product?
<inform me>

> If I were going to count more C packages I'll also count Aztec C and
>Manx C (they are actually the same). You can have more packages and that
>doesn't necesarily means you have a better C. I guess that Borland's C
>could be better than any of the Amiga/ST packages.
>

But Pure C is Borland C, meaning... :) the ST has the best one, silly, if
that's what you think. :)

But compiler flaming aside for a moment, i does appear the ST has more.

> At least the Amiga has at least two versions of C++.
>

What are they? The Atari has Comeau C++ and GNU C++.

Then you'll have to do the same with the A1200 figures since those also were
concieved with the Cache on.

That way the A1200 will NOT be faster.

A Falcon with FastMem will also be faster.

My car is quite fast too.

Can the base A1200 do virtual memory? Just played around with it ... 8 Meg RAM
is quite handy for viewing/editing big pictures ..

Maybe I should set up my 100Mb partition as Virtual Memory ...

Not bad for just cutting on a little 256-byte cache, eh? :)

(with a 16k cache, it'd probably be a real monster)

>
> This huge increase show how cripling is the Falcon's bus, but at the same
>time how it benefits from the cache inmensely.
>

Well, you're saying it is crippled, but if I remember this correctly:

1) the 68030 is standard on the Falcon.
2) the Falcon is usually used with the caches on.
3) there is no reason to cut the caches off (why would you? it can't run
timing sensitive software any better... Spectrum 512 would die anyways!
and who would need that with a 16-bit video mode available?)

So, the architecture is NOT crippled because:

1) the cache is part of the system
2) the cache is usually on

It's not like an add-on card. The cache is in the CPU.

> Taking your numbers, an A1200 with FastRam will be a tad faster. On other
>application types the benchmark improvement is not as generous.
>

We have not seen a benchmark of other application types, so I'd wait until we
could see those before rendering judgement.

> I encourage Falcon owners to do this kind of test with other applications.
>
> Thanks for sharing that information. It shows that at least the Falcon

Typical Mac owner mentality. :) Always willing to pay more to do the same
thing. :)

Pete, I'm not even an Amiga owner and I'd have to say it runs better than
System 7 does on comparable Mac hardware under WB 3.0.

Geeez.

Your problem is, you need to get more than just a superficial glance at
a machine and a spec list before you diss it.

Hee Hee Hee

Ha Ha Ha.

Jesus. What a bunch of arguing brats! I have never seen so much bickering/arguing in my whole life! This whole "Mine's bigger'n yours!?" arguement is just too much. We all know the differences between the 1200 and the 030, so why do you keep asking dumb quaetions of each other? I thought this was supposed to be a discussion group, not a slang match.

If I remember correctly, the original end of the thread was a speed/hardware comparison between STOCK 1200's and 030's. Not if you add fastram, or a faster processor, or this, or that.

What is the point of this argument? The are both great machines, and I think we should concentrate on getting a foot in the door again - I can remember when 680x0 machines had a fair share on the market - now it's contempibles.

How about promoting BOTH computers, not picking each other to little bits?

Grow up guys, and have a DISCUSSION.

Karl.

Flame me, and prepare for no reply at all....

: >old second hand Lattice C, or get Matt Dillon's package to do their
: >programming.
:
: Let's get this straight.
:
: 200,000 A1200s sold since the release... probably more. "It's NOT just a
: game machine", but....
:
: ...they still can't run GNU C?

Well, if the main programmers behind the GNU C port are often writing
Linux 680x0 for the Amiga, then I doubt if they could be bothered
redoing the gnu c library. If you poke around in the Unix newsgroups,
you'll see that it's up and going.

Last count there were three separate unix-a-like projects for the amiga
going.

: Well, I hate to break the news to you, but if 200,000 Amiga 1200 users can't
: seem to port GNU C and this tiny group of ST/TT/Falcon owners can, then that
: seems to imply that Amiga 1200 owners don't seem too interesting in programming.
:
: (at least, not in programming in a UNIX-like manner... GNU C is best fo that...)
:
: >Most A1200 go for a better freely available package instead of GNU C.
:
: Really? And what package is this? (I'm not saying GNU C is the best, but
: their compiler does a hell of a job on optimizing and the GNU project has
: been at this longer than most people who write one in their spare time...
: most homebrew compilers can beat it in compile speed, others in terms of
: optimizations, but few can offer the options of GNU's)

It's DICE. Lots of support packages that have hooks for DICE. Can't
say the same for GNU C. I doubt if many programmers want to have command
line-driven unix-a-like programs when they could have something that
fits better into the operating system with windows, menus, icons.

I don't know if DICE is better than GNU C, but the programmer has ported a lot of software across, written his own compiler, written tonnes of software, editors, etc and is now working on the Linux/Unix project for from the last I heard. His compiler is meant to be going commercial soon, so it must be half-way decent.

I can get editors with AREXX scripts, keyboard customizations, etc for DICE and lots of other programming languages. Not much support GNU C directly.

: >I guess the Falcon owners have to roll their own, as nobody is writing
: >software for them...
:
: Hmmm. Ok, you say Amiga has SAS/C, Matt Dillon C and GNU C.
:
: The ST has HSC, Pure C (formerly Turbo C, that nice package from Borland),
: GNU C, and the latest version of Lattice C.

High-Soft C is hardly Borland C. Just like High-Soft Pascal is Turbo Pascal. They're both a few versions behind the Borland offerings.

: In the C compiler war, looks like the Amiga is lacking ammunition. :)

Okay, GNU C, DICE, SAS C (which has bought out Lattice Completely), Comeua C++, HiSoft C (seems like only the Brits use this), Manx, Aztec C. All of them are commercial offerings, except DICE, which is shareware but going commercial.

SAS C seems to be the main tool, as it still run okay on a 1meg A500 with two floppy drives. Same with DICE. You're cutting down on your possible end users when your GNU programs have a nice big 255K library that must go with it. Lattice is now SAS/C. I don't know if it's true for the ST system.

I'm not a programmer. I've only seen a few programs on my 340MB hard-drive that have actually bothered using GNU C to compile their programs, as these were mainly direct unix ports (like Star Wars adventure and the old Colossal Cave adventures). A lot of utilities and applications use DICE or SAS/C. As for what commercial programmers use, I have no idea, as I don't have enough $$$ for lots of apps that I'm not going to use.

If there are better alternatives to gcc in terms of good code
generation then someone must of done an awfully poor port of gcc for the
Amiga. Gcc is fairly well known in the unix world for the quality of
it's optimizer, to the point that people with Sun's run gcc and throw
away Sun's compiler.

>Falcon specific version?).

Just what '030 instructions did you have in mind that would make gcc run any more efficiently? Actually all that would be needed to get a '030 specific verion would be to recompile it with itself with the '030 flag set.
As for the linux port to the Amiga, I agree with you there. I beleive that there are a few Atari programmers working on a linus port to the TT, and it only makes sense that they would build on and co-ordinate their work with the Amiga people. However, most of the Atari, and Amiga users who are really interested in running linux have gone out and bought the machines that already run linux, in other words, pc clones.
It only makes sense. The number of people running linux alone probably outnumber the people running Amiga 1200's and Falcons. If someone reports a bug in one of the linux groups, someone usually posts a fix in less than a day.

> Borland does it?

Pure C was originally a licenced port of Turbo C. Borland, for some incomprehensible reason, would not allow ASH, the porters, to release an English language version, even though Borland obviously had no interest in selling it themselves. When they decided they didn't even want their name on an Atari product any more, they sold the rights to use the dcode to ASH, but again stipulated that there would be now English version. However, all the menu items are in English, so any intermediate C programmer can use the package with little problem.
Pure C is, without a doubt, IMHO, the best integrated development package I have seen on any platform. After seeing Borland C for dos, and Borland C for windows, it's hard to believe they shere the same heritage. The Pure C debugger is light years ahead of anything I've used on any machine.

>|> GNU C, and the latest version of Lattice C.

> For your information, SAS/C is the 'next generation Lattice C.'

Latttice again licenced their compiler to HiSoft, who basically hacked their DevPac ide onto it. It's supposed to be a good compiler, but they've been promising a source debugger for longer than I can remember.

See above on the Borland C issue, you're dead wrong. Also, Flip missed a few of the more obscure ST compilers. There's Aztec, though I'm not sure they still maintain it, Megamax, Mark Williams, both Sozobon and Ian Lepore's modified Sozobon, and even Mark Johnson's.

> At least the Amiga has at least two versions of C++.

As has the Atari, as someone mentioned a while ago.

One thing the ST is definately not short on is programming languages. Another is text editors. The number of extremely high quality text editors available for the ST is amazing. Of course, with 1/2 of them, you have to translate the resource files from German to English. ;-)

## 2025. Lame amiga magazine

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-22 07:08:37 UTC
From: runeh@dhhalden.no
Message-ID: <runeh.2.2C9FF9F5@dhhalden.no>
Source record: 21305
Cross-posted to: comp.sys.atari.advocacy,comp.sys.amiga.advocacy

When I read a amiga magazine I can't remember which one. I think it was Amiga Format of CU Amiga, they were discussing games consoles and the CD32 was of course the best "affordable" console. When the Jaguar was mentioned by someone I think It was a reader, the the staff only made fun of it, claiming it didn't exist and that it couldn't be a 64-bit system (is that because commodore hasn't got one?) and that it would never see the light of day even tough it was already shown in the US. Further they said that Atari couldn't succseed even if it existed.

Well talking about succeeding.....

I work in a computer store here in Norway that sells both Amiga, Atari, PC's, and Nintendo. We got an offer from a company that sells amiga machines for commodore in Norway. It was to sell the CD32 and earn £20 (not a mistype) per machine sold. This is before we deduct freight and handling which is aproximatily £10 all together this leaves £10. This low earning means that we don't want to have more than a couple of machines in stock, perhaps not more than a demo-model cos the stock-cost would eat up our earning. This means that we can deduct even more. Lets say £3 in phonebill and work it cost to order a machine and another £25 in handling when you buy goods from that firm which amounts to less than £500. This means in fact that we "earn" £ - 18. Wow won't we get rich on the CD 32. This means that all the small stores that sell amiga will lose money on selling the CD32 even the big stores will not make money on it. Even nintendo 8-bit consoles at a price of £950 gives us more profit than the more expencive £ 340 (which it cost in Norway). These loss we "make" by selling the CD32 will in fact increase in time since the prices I calculated it from was introductory prices. The increase will be £10.

If we choose to sell this so called "breakthrough in technology"... (I just wonder what that will make the 3DO and the Atari Jaguar) It would be just to get the ones who buy it to come and buy games from us, but since Commodore has said that the price on the games are to be low (good for the users though) the profit will probably be low to. Lets just hope it won't. As for advertising their plans in Norway look promising. But their loss last year wordwide and in Norway do NOT.

Greetings from

Rune Hyldmo, anti sig.file activist

Did. It's like an old version of Turbo C and Borland gave up on Atari
(they never really started for Amiga).

But then I'm not impressed by Borlands products anymore.

[snip]

>Yea I play around with Workbench 3.0. To bad there isn't any useful software
>for it.

The only reason you can't get GNU C to work on a stock A1200 is that you need
at least 4 to 5 megs of ram, which the stock A1200 doesn't have (2megs.)
As for the 'lack of useful software' OS3 has not been around long enough for
large volumes of software to be produced for it specifically. All useful
software will probably have been written following the Commodore rules and so
should be fully compatible. (Otherwise it wouldn't be very useful. :) )

(Note, I'm an Atari owner myself, so this is open
to "all software written following Atari's rules should be compatible with
different OS's...", which is, unfortunately not always the case, eg, the
scan routines in the falcon(TOS 4) mapping return to '\0' and other TOS
versions having return mapped to '\n' in the scan functions...)

Workbench 3.0 is more compatible with other versions of Workbench (1.2, 1.3
2.0), compare this with the difference between, say, Windoze 3.1 and 3.0. ;)

And for all the other Atari owners out there, I prefer the Atari over the
Commodore, otherwise I wouldn't own one, would I? :) And I'm busy getting
money together for a Falcon 14/65 myself...

Then I should be right in the asumption I made MONTHS ago that they use a 32Mhz bus instead, giving it the same performance as a 16Mhz 32bit bus ... Ok, that's all I need ..

```
Atari themselves now use Lattice C from Hisoft.
You can also get Aztec C, Hitech C & Prospero C for the ST.

|> access to RAM?
|>
|> 16-bit bus to CPU?>

The Falcon shouldn't even be able to keep up but to surpass
the A1200. Remember an A1200 with no FASTRAM access chipram @ half
the speed (although internally still goes @ 14Mhz).

That's why adding FASTRAM on the A1200 gives at least 1.5 improvement
on real-world apps. This is faster than the Falcon.

The mere fact that the Falcon just 'keeps up' means that it has
a problem (16-bit data path). The 68030 by itself has optimizations
of up to 50% faster than the '020 at the same speed.

I can play that game very easily too Flip. The point is that
the Amiga has a lot of support. I could say the same for Linux: where
is it on the Falcon? This is the latest home/hacker's OS.

|>
|>
|> >And BTW, isn't the GNU C version you run on the Falcon the same as the ST version?

|> <inform me>

No, the other way around. Lattice is a C product. On the Amiga,
Lattice went up and then SAS took reponsability for it. The latest version
is 6.30 and there's a new one coming in October. They currently advertise
in Amiga magazines.

|>
|>

Could it be the rumored 16Mhz TT access to memory? I heard that in this group. Also remember to take benchmarks with a grain of salt.

If the benchmarks that ran on the TT are the same kind posted around here by Heiko, then surely the Falcon will be 50% of the speed (after all, running off from the cache means a lot, right Rickard? :-| )

|>
|> Where do you find any crippled busaccesses in those figures?

Read above.

|> timing sensitive software any better... Spectrum 512 would die anyways!
|> and who would need that with a 16-bit video mode available?)

Don't jump to conclusions too quicly Flip. On the other posting
the improvement is 46%. Any application (multimedia) that requires
animating the screen will suffer painfully.

|>
|>
|> So, the architecture is NOT crippled because:
|>
|> 1) the cache is part of the system
|> 2) the cache is usually on

It IS CRIPPLED. Why?:

1. 68030 is a 32-bit chip with internal 32-bit registers and
designed to be used for 32-bit datapaths.

2. No BURST MODE allowed on the Falcon. A 68030 feature.

It is crippled Flip.

|>
|>
|> It's not like an add-on card. The cache is in the CPU.

Read above.

|>
|>
|>
|> > Taking your numbers, an A1200 with FastRam will be a tad faster. On other
|> >application types the benchmark improvement is not as generous.
|> >
|>
|>
|> We have not seen a benchmark of other application types, so I'd wait until we
|> could see those before rendering judgement.

True. But then why you jumped to conclusions so quickly above?
Remember, there was another application and improvement was 46%.

|>
|>
|> > I encourage Falcon owners to do this kind of test with other applications.
|> >
|> > Thanks for sharing that information. It shows that at least the Falcon
|> >doesn't get under some real-world applications as crippled as I originally
|> >thought.

|> Which was the whole point of what I was saying in this thread!

Hmmmmmmmmm.... Perhaps you shouldn't deviate from that point then.
The point is that people started comparing to the A1200 in a VERY UNFAIR
benchmark. The truth is that it seems that the A1200 seems to be from a
tad faster to a decent percent in real world applications.

The mere fact that this seems to be truth, and that the Falcon's '030
runs 2 Mhz above the A1200 '020 and that it is a '030 CPU shows that
the Falcon has a crippled CPU. Not too bad for some applications, but
bad anyway- particularly when people wanted to say that it was way
faster than the A1200.

|>

In article <H.eg.LUeVKttnE0c@semprini.waterloo-rdp.on.ca>
cherborth@semprini.waterloo-rdp.on.ca doggedly continues with:
>In <1993Sep16.164144.24660@btree.uucp>, George Crissman writes:
>> The DSP is a general-purpose coprocessor. Suggested uses include
>> low-cost fax/data modems, voice mail systems, and direct-to-disc
>> digital audio recorders (suggested by Atari in their Falcon brochure).
>> The fact that you're surmising it's also used in the Mandelbrot
>> demo shows how versatile it is.
>
>The DSP may be a general purpose processor, but it requires _highly_
>specialized programs to be of any use. It's certainly not going to make
>PageStream or gcc run any faster.

Not unless they're 'DSP aware'. And if they're not 'math coprocessor
aware' they won't use the math chip, either. In fact, any software
that doesn't look for & use the features of the hardware won't be able
to use those features, which means _of_ _course_ they won't run any faster.

That's why software is subject to upgrading.

>> OS/2 (short for "Operating System/Two") is a Disc Operating System
>> (DOS).
>
>Now you're picking nits.

There seemed to be some confusion about whether 'DOS' was a generic
term referring to any Disc Operating System, or whether it referred
to a specific operating system, such as MS-DOS. My point was that
'DOS' is a generic term, and that it's ludicrous to claim that "My
computer doesn't even *have* DOS."

>> >Sure, TOS has disk-access calls, but it's certainly not running DOS (be
>> >it MS-DOS, PC-DOS, DR-DOS or whatever).
>>
>> TOS (short for "The Operating System) contains a Disc Operating
>> System (DOS) called GEMDOS. It is not MS-DOS, although it uses
>> MS-DOS file formats.
>
>It's not a DOS though; you can boot with no disks at all and even run
>programs (off cartridges).

Yes, we agree again! An Atari *can* boot with no discs at all and
even run programs because TOS includes a Basic Input Output System
(BIOS). MS-DOS machines *also* have a BIOS, in ROM no less!
Unfortunately, MS-DOS machines don't have a cartridge slot, and I

don't believe they even support audio casettes for data/program
storage and retrieval (like the ZX-81 did...).

...And TOS also includes additional functions in an eXtended
BIOS (XBIOS), as well as standardized graphics in the Virtual
Device Interface (VDI, a part of GEM), AND the windowing
environment of the Application Environment Services (AES, a
part of GEM). All of this, including the GEMDOS Disc Operating
System, is included standard in the Atari ROMs.

But this isn't in the ROMs contained in MS-DOS machines. They're
considered to be extra cost 'options'.

> This sub-thread is useless semantics (and them's fightin'
>words coming from a semiotician! :-)...

OK, you got me on this one -- semiotician isn't in my dictionary.
What does it mean? (This isn't some vague 'Iowa' joke, is it? :-)

>But WHAT are you going to use the DSP for? Drawing windows faster?

There is a list of Atari-suggested applications at the beginning
of this posting. Or are you asking about what it does at the
programming level? If so, that would best be answered by the
DSP user manual, available from your local Motorola representative.

>> Compatibility is important! Ask any user of the MS-DOS machines! :-)
>Compatibility also cripples machines, and software, _any_ software,
>should't take over a year to appear.

I agree with you if you're saying that compatibility is the reason
that the MS-DOS machines:
a) Require massively-large programs to run properly,
b) Require a '486 @ 66 Mhz to provide a level of
performance comparable to an Atari Falcon '030 @ 16 MHz.

>And I certianly wouldn't call anything Atari does 'actively
>supporting'

"My eyes are firmly shut," he said.

>the SD Computer Fair was probably put on exclusively by user's
>groups and dealers.

It was sponsored by ComputorEdge Magazine (formerly the
Byte Buyer, until contacted by the fun-loving, friendly
attorneys at Byte Magazine :-( ) and the San Diego Computer Society,
the umbrella organization for the majority of user groups in
the area. There was a lot of media promotion (radio and newspaper,
maybe more). Several radio stations attended, sponsoring such
attractions as a computerized jazz concert, and a live broadcast
of a (weekly) computer call-in show.

In addition to Atari Computer, other manufacturers such as Microsoft, Aldus, and International Business Machines were in attendance displaying their wares. There was a separate wing of the building (almost another building, really) for sales of hardware and software by local merchants. And they were doing a brisk business, BTW.

In addition to the demonstration area and the vendor area, there was a substantial number of seminars offered during all three days of the event, ranging from tutorials on specific software packages to overviews of the latest developments in the field of computing.

With a projected attendance of 20,000 people, multiple seminars covering many platforms, and attendance by industry leaders, this wasn't one of those card-table-in-the-multi-purpose-room shows.

>> Sorry, I didn't mean to start a compiled-code shootout here. I was
>> attempting to show that the inefficient architecture of the MS-DOS
>> machines caused an expansion in executable code size when compared
>> to the source code, while the efficient TOS architecture caused
>> a reduction in code size.
>
>My compiled-code example simply showed that your hypothesis wasn't true.

Lessee ... my 10K source contracts to a 5K object on an Atari, and balloons to 18K (give or take a K or so) on an MS-DOS machine. Your code compiles to the same size on both machines. I think what we have here is a case of classic "specsmanship", in which we both select a true example to prove our side of the debate. We won't get anywhere continuing this line of discussion.

>The version of Word that I use at work (5.0a) is about the size of
>AtariWorks.

First you say that your word processor (Microsoft Word) is better than a desktop publisher (Pagestream). Now you're saying it's the same size as an integrated package of word processing, spreadsheeting, and more (AtariWorks). This is still an apples and oranges comparison.

>The $1500 '486dx/33 with 4M and a 100M hard drive, PLUS the monitor, is
>faster and more capable than the $1500 Falcon030/16 with 4M and a 80M
>hard drive, WITHOUT the monitor.

Do I need to drag out the '486 @ 66 MHz / Falcon benchmark again? Or mention that an 80 Megabyte drive on the Atari is equivalent to a 240 Megabyte drive on an MS-DOS machine? Or that 4 Megabytes of RAM in a Falcon provides equivalent space to 8 Megabytes of RAM elsewhere (assuming OS/2 and not Windows/NT)? Or (as noted elsewhere) that computers work better with a monitor, an item included in the $1500.00 Falcon price?

> A computer is useless if you can't get
>any software to make use of the 'features' that you bought it for (like
>the much-touted DSP for example).

A computer that is compatible with it's predecessor is very useful,
because it can run your suite of existing programs. And as the
software is upgraded (and new software is released), you'll be able
to make use of the power contained in the new features.

>> Comparing a word processor (Microsoft Word) to a desktop publisher
>> (PageStream) will certainly make the word processor look good in the
>> speed department! :-) Have you tried comparing software that runs
>> on both machines (Microsoft Write springs to mind)?
>
>MS Write for the Atari is a pathetic spectacle compared to the small and
>occasionally useful Write that ships with every copy of Windows or OS/2.

So you don't like it on *either* platform. That seems to be a fair
and well-balanced opinion. :-)

|>

I don't think this says anything about the Falcon's bus. There is no way to determine it's effect except to compare it to an almost identical machine that has a 32-bit bus. It's the same reason you can not really do simple little benchmarks to compare the Falcon to the A1200 or any other machine. There is a great lot of other things in a machines archeticture that affect its ultimate performance for the user that have little to do with just the speed of the processor or the size of the processor bus.

My math was corrected from my previous post showing what I thought was a 30% increase was actually a ~50% increase resulting from using the Falcons (or 68030s) cache.

I thought this was pretty good, but I was still skeptical myself. So I tried another test with STZip (a file compresser, archiver). I timed this with the second hand on my watch, so it may be off by +/- one second. The start time was when I clicked the button to start the compression and the end time was when the program closed the window/'beeped' at me indicating it was complete. This timing included the I/O time for loading in the raw file and writing out the compressed file.

Using a rather large file, I found that without the cache it took ~50 secs and with the cache it took ~24 secs. I tried this several times and it was the same each time.

Guess what, folks! This was a real world application which saw a ~100%+ increase in performance by using the cache!

So from what I have seen, it looks like the cache on the Falcon's 68030 can give anywhere from 50% to 100%+ increase in performance. It also shows that the original benchmarks are in fact valid for a best case scenario (which can be seen in real world applications, not just in theory).

Of course, as I said above, the benchmark only shows one small aspect of the machines and still says nothing about overall performance.

RandyH

Well, I agree the Amiga has a lot of support. Especially in games and video,
and also in multimedia (a derivative market from its video market). The
compilers... well.... they DO exist (I've gotten quite a response about
that), but I've also noticed they aren't any more plentiful than the ones
available for the Atari ST/Falcon.

(give or take 1 or 2 compilers either way)

>

So what you're saying is Lattice dropped their C compiler for the Amiga and
another company picked it up.

That sounds a lot like the way Borland dropped Turbo C and someone picked it
up and turned it into Pure C.

So I take all flames you've made or even hinted at about updates to Pure C
and throw them back at your version of Lattice C. :)

>

The other commercial one is probably Comeau C++.

Just out of curiosity, why did Lattice drop their Amiga C compiler but
go ahead with a C++ compiler? Seems odd....

(it's not like it is a crowded market!)

I get the feeling that if this were a Falcon, Amiga owners would say it was crippled because of that. :)

> That's why adding FASTRAM on the A1200 gives at least 1.5 improvement
>on real-world apps. This is faster than the Falcon.
>

Let's back up to the disputed benchmarks, which I admit I don't have a copy of... you're saying the Amiga 1200 runs 50% faster with FastRAM or 1.5x faster with FastRAM?

The reason I ask is because in some of the tests, the Falcon ran 2X faster than the Amiga (not something I'd personally expect in every app, mind you) and in others eeked out around a 10-20% increase.

If FastRAM boosts performance 50%, that may make it only slightly faster. However, until we get benchmarks on a FastRAM equipped A1200, I'll refrain from taking a guess.

> The mere fact that the Falcon just 'keeps up' means that it has
>a problem (16-bit data path). The 68030 by itself has optimizations
>of up to 50% faster than the '020 at the same speed.
>

Well, let's ask ourselves this: What is so wrong with the A1200 that a crippled 16-bit 68030 gives better performance?

I mean, early on, we had this whole thing about "A1200 is 15% faster than a Falcon!" and now the only set of benchmarks we have goes the other way (thoguh i agree they are biased towards the harvard architecture of the '030), it has also been demonstrated the caches do give drastic improvements on applications such as MGIF (as demonstrated in another post).

So given this knowledge, what is causing the A1200 to run slow enough for this 16-bit 68030 to keep up?

<that's the question I really want to know the answer to!>

Incidentally, I'm still saving up for both. :) In fact, I'll have to make a seperate post for info on some questions I have....

>

Why would animation slow it up? Granted, the more bits in the display the
more bandwidth devoted to video and the slower it will be for the 68030 or
any of the custom chips to move a block of screen data (simply because of
the depth of the image in bits)... but this A1200 will have the same problem
with no FastRAM.

Come to think of it, if all of the animation is being done in ChipRAM, the
A1200 would suffer more (%-age wise) because all writes to the screen
are done in ChipRAM and the CPU at those times runs at the "crippled" Falcon
speed, right? :)

>
> It is crippled Flip.

>

Point one is partially taken... to fully exploit the '030's powers they should have used a 32-bit datapath. I agree totally with that.

However the 68030 DOES function on a smaller bus.

Point two.... .well, yes, but if this is an '030 feature, doesn't this also mean the A1200 would lack this feature as well (crippling it, i'm sure) because the '020 doesn't have it?

Come to think of it, why did Commodore go with the 68020 when 68030s are so cheap?

> Hmmmmmmmmm.... Perhaps you shouldn't deviate from that point then.

What real world application have we run to prove that statement? Name the one application we ran on both that substantiates that, and I'll shut up.

Really, you're stating something without any means of backing it up.

To bad that Linux won't be available for the people who have an A1200.
Unless you buy a 68030 and stuff it into your A1200, since the 68020 doesn't
have a MMU...

>And BTW, isn't the GNU C version you run on the Falcon the same as the ST version? (i.e. ,
no
>Falcon specific version?).

What has that to do with it? GNU C is GNU C is GNU C...
Cut from the online manual for GNU C (which says it all):

Configuration Dependent Options
M680x0 Options
-m68000 -m68020 -m68020-40 -m68030 -m68040 -m68881
-mbitfield -mc68000 -mc68020 -mfpa -mnobitfield -mrtd
-mshort -msoft-float

--- end of cut ---

What I can't understand is why CBM botched the sound in the A1200. Can't be
so hard to put in say 4 channels 16 bits in upto 50kHz or something...
(The F030's soundsystem isn't that great either, especially to program)

Uhm.. 'true SCSI-II' ??? Well, SCSI-II is the better defined standard of
SCSI, ie. SCSI-II can handle all the old SCSI "sub"-standards that arose from
different manufacturers (more or less anyway).

SCSI-II also supports wide SCSI and differential SCSI, but generally you need
both a device and an interface that handles those.

I was just reading in an Amiga magazine (no I don't remember which one, it
just had the CD 32 on the cover)
Things don't look good. They said the Commadore is betting the barn on CD32.
With the company only worth 90 mill, that its looking for either CD32 to be
its savor or a "suger daddy" to bail them out through take over.
With this, it also seems unlikely that the Amiga line of computers will be
advance. The article seem to suggest that they were giving up on the
computer market.

However, its worth mentioning that expanding the CD32 into a full Amiga 1200
seemed like a likelyhood.
So maybe the amiga will compete at another level.

No, Lattice went out of business/were bought out by SAS Institute. SAS still
releases un-updated packages as Lattice, but call updated versions by the
SAS name. For example SAS/C but Lattice C++ on the Amiga. This was my
understanding... And it seems to be supported by version numbers 5.6 on Atari
Lattice and 6.30 on Amiga SAS/C (as both were originally released at around
the same time.

While the attention that the Atari Jaguar is getting from various magazines is encouraging, I am surprised that the 3DO is garnering more attention. In the September issue of Time, the Atari Jaguar is barely mentioned, compared with paragraphs and photos of 3DO and its makers. Both systems offer comparable power, yet it seems that the media has already counted Atari down and out (and Jaguar hasn't even been released yet!) while they focus attention on a much more expensive system. The magazine WORTH advises investors to look into the rage of the future... the 3DO! They make no mention of Atari whatsoever.

I don't see the masses attracted to a system priced in excess of $675, but a $200 Jaguar unit looks very attractive.

With proper marketing, Atari could make the Jaguar a huge success. They need some impressive software, a good marketing strategy, and maybe even a mascot for it (like Mario is to Nintendo as Sonic is to Sega). This could be the big chance to push the Lynx back into stores as well. The Jaguar and Lynx, together, make a well-rounded display of computer game systems that could appeal to many stores (and hence their buyers). This may be Atari's last chance to become a prominent figure in computer entertainment.

Yeah, but given Atari's track record with previous game systems.....

I guess we can always hope and pray, eh?

Lynxer to the end....

Linux on the Amiga is "up and running"? That is stretching things a
little. The version number is 0.05.1 - ie. it just barely runs.

Not that I'm knocking the Linux 68K development. Linux 68K development
is progressing on both Amiga and Atari machines (>=030 only, of course),
and this is a Good Thing.

>(with a 16k cache, it'd probably be a real monster)

Gain from larger caches diminishes quite rapidly. If a 100%
improvement is gained with the 256byte caches of the 030, it is
unlikely you'd get much at all from 16k (since the algorithm's inner
loops are already fitting in the cache, it would appear). Many of the
"caches" you may have heard of on Intel based machines are not on-chip
caches, but merely a "secondary cache" - needed when the access between
the CPU and main memory is very slow (eg. 8-bit busses on many clones).

The PowerPC however has 32K (*2 or /2, I cannot recall) of cache ON-CHIP.

Will Atari follow the trend (eg. Apple is moving over completely to PowerPC)?
I hope so.

Up until this year I have been actively involved in Lynx discussion on Prodigy.
(Rates got too expensive on *P.) We decided long ago Atari needed a mascot.
I think we finally decided they would have to go with the "cat" theme--like a
big black panther or some similar feline. But don't count on Atari to market.
They've always counted on the consumer to market the product for them by word
of mouth. Unfortunately, that doesn't work when you have advertisers as big
as Nintendo and Sega. I hope they hire a good Advertising agency. They
obviously don't have one now (and haven't for the last few years!)

I guessed you missed that bit of market analysis that showed computer
sales _rising_ over the rest of this year.

> Not competitive? It takes a '486 @ 66 MHz MS-DOS machine to keep up
> with a 68030 @ 16 MHz Falcon, and it's the *Falcon* that's not
> competitive???? <incredulous look> One needs to spend a thousand
> dollars _more_ just to get the same performance as a Falcon, yet
> the *other* machine is 'competitive'? <even more incredulous look>

I guess you missed all those posts by myself (and a cast of thousands)
showing how the aforementioned '486 absolutely CRUSHED the LIFE out of
the Falcon when it came to real work... like raytracing. :-)

I guess you missed all those posts (and all those many, many magazines
at the local <whatever> store) showing that a _complete_ '486dx/33
system _with_ the monitor is the cost of a Falcon030 _without_ a
monitor.

Or maybe you're just ignoring them since you don't believe that anything
could be better than the Falcon. How do you feel about the new AV Macs?
They're based on a nice fast chip (68040) and have a nice fast DSP which
is probably better than the one in the Falcon (from the specs it looked
a bit better; I haven't seen anyone claim either way though).

> And knowing that the rate of change will make the 'other' machine
> obsolete in about three years is more competitive than a machine that
> remained usable and productive for eight years? <thoroughly
> incredulous look>

Oh, I guess PC owners are somehow prevented from doing exactly what
you've been _forced_ to do... ie, keep using the same software for the
better part of a decade. Does Mickeysoft somehow _force_ everyone to
buy the 'latest' version? I'll bet you there are more WordPerfect 5.1
users than there are Atari users, and that's an 'old' version lacking
many of the wonderful (?) features of WP 6.0.

> I don't think so. The MS-DOS machines appear to be the ones that
> are 'not competitive'.

Then, maybe, just maybe, people will have brains and STOP USING DOS.

> You're right, they _can't_ demo the Jaguar yet. But if Atari was

> then they would *not* have been at the show at all. My point: Atari
> is still actively marketing the Falcon.

No they're not; they never started. You keep ignoring the people saying
that the 'great Falcon demo' that was being discussed was put on
completely by user group personelle; not a single Atari worker was present.

> In another response, I've copied a question posed to Bob Brodie of
> Atari and his answer relating to future Falcons. In short, Bob says
> there will be more of them coming down the road.

That's the line he's been feeding us for over a year; still no plans to
actually _release_ one though. It doesn't take massive amounts of
resources to _plan_ your company's future, does it?

>comparable power, yet it seems that the media has already counted Atari down
>and out (and Jaguar hasn't even been released yet!) while they focus
>attention on a much more expensive system.

There are many reasons for the media to focus more on the 3DO, and none of
them are indicative of an anti-Atari bias:

1> The 3DO has been talked about since January 1993. The Jaguar was officially
rolled out just last month. Hence more time for the 3DO to get into
people's ears.

2> Trip Hawkins has access to a bigger PR arm than Atari does. Atari can court
the video-gaming media (a good move), but Trip can ostensibly get word of
the 3DO out to more places, not just this (relatively) small audience.

3> The 3DO has a gimmick. It's not "another video game machine", but a
hardware protocol/platform. The popular press loves gimmicks. How much
coverage did Time give the Super Nintendo when it came out? Not a whole
lot, because it didn't have an original angle to it.

>I don't see the masses attracted to a system priced in excess of $675, but a
>$200 Jaguar unit looks very attractive.

I wouldn't get too worried about things. If Atari gets Jaguars and games
out at a good price, people WHO ARE INTERESTED in video games (e.g., the
folks reading this in rec.games.video.misc and alt.games.lynx) will hear about
it and buy the stuff. Time, Newsweek, and the Wall Street Journal may not
bother to report things, but that hardly matters -- if the HOBBISTS know
and support the stuff with their buying dollars, that's all that counts.

It only will run on 68030 or better? Does this mean A1200 owners are
out in the cold regarding Linux? (unless, of course, they get an '030
board).

How usable do you think Linux would be on a Falcon? A 16mhz 68030 may
run MultiTOS or MiNT fine, but I would think Linux would be much more
demanding.

If somebody has the a benchmark suite, with source code and
compiler options, you could post it in comp.sys.amiga.programmer
asking somebody to run this program on their Amiga 1200 and
ask for them to post their results and system set up.

DO NOT crosspost this thread in c.s.a.programmer, as it will
p*ss a lot of people off!

From: kendall@flammulated.owlnet.rice.edu
Message-ID: <KENDALL.93Sep22215710@flammulated.owlnet.rice.edu>
Source record: 21139

I've read a number of posts latley saying how a 33% improvement by using the cache "just shows how bad the 16-bit bus is for the system".

What? Are you then saying that with a 32-bit bus, that the cache would not help at all? I believe that an A1200 owner with a 68030 upgrade posted almost the exact same speedup with his 68030 as well, running on a 32-bit bus.

I'm not saying the the 16-bit bus gives no slowdown at all, I'm saying that the cache results are a fairly useless measure of how mach drag you get from a 16-bit bus, because the cache would help some on either system. Is there any way to get the 68030 to report a hit rate for the cache?

Well then, it looks to me like no-one can say anything much about the 16-bit bus based on the cache results... What you'd really need is a real 32-bit Falcon to compare with, perhaps a Falcon with an accellerator card running a program from fastram.

ObInflammitoryRemark - The 3DO will never sell at $700, the CD-32 will never sell at any price, the Jaguar can be used for everthing from car-buffing to food dehydrating all while rotating a transparent True Color (not TrueColor(TM) you idiots, get it straight) animated morphing picture of Norm from Cheers and playing every national anthom on earth at the same time. ;-0

Cheerfully,

What the heck would you expect Bob Brodie to say in answer to that question? Isn't this the same guy who was telling people for months that FSM-GDOS was delayed because the packaging was later, while in actual fact Atari had long before decided it was a dog and would never be shipped. I tend to take anything said by Bob Brodie with a large box of salt, as his track record is fairly dismal.

On the contrary, linux would probably be quite zippy, even on the
16mhz 030. It does relatively well on a 386SX, or so I've heard. I
wouldn't particularly care to try running X though.
X may also be a problem for the linux porting team, as XFree that
linux uses is also very X86 oriented. Fortunately for anyone trying the
port, however, there'll only be couple of video systems to support.

Wait, the Falcon's blitter which is rated at 64 million pixels per second
(compare to SNES at 1 million & 3DO at 16 million) has 32 bit
access to RAM. Multimedia (page flipping) for the Falcon is no problemo.

Yeah, I can see a lot of A1200 user wanting to use Unix on their machines.
Especially considering it can consume 170mb for the binaries/docs/etc and
a 30 mb swap space.

: >And BTW, isn't the GNU C version you run on the Falcon the same as the ST version? (i.e.
, no
: >Falcon specific version?).
:
: What has that to do with it? GNU C is GNU C is GNU C...

Well, it's got just as much as relevance as running Linux on an A1200 as
a measure of speed.

Flip is saying that Amiga users aren't "serious" because they haven't
got GNU C working on a base A1200. I heard that ixemul.library required
for GNU C programs doesn't work under KS3.0. This may or may not be
fixed, but I don't know and I started this rumor (which, I think I
got from the Latex documentation, which is a gnu C compiled program).

Ricardo is saying that you didn't need to change anything to get GNU C
running on the Falcon.

The problem is that the main forces behind the GNU C port are off working
on NetBSD, Linux or something or other. If the talented people behind
a project are working on something else, have exams, off on holidays, etc
nothing much gets done (eg. NetHack 3.1.3 official binaries, new library
which may or may not be broken under kickstart 3.0, etc)

>8-bitplane playfields?

>Dual Playfield in 256 colours.

Bollocks! It just doesn`t work that way!. You would need proper
colour registers to do that!

The Amiga offers dual playfields as standard, but you can also
twiddle the bitplanes to do paralax effects. I gather that the
`true` colour (24 bit is TRUE colour rick) is chunky, so I`d be
interested to see how this Amazing imaginary 256 dual playfield
screen works...

Why do you constantly make stupid claims about the Falcon? You
aren`t doing it`s credibility any good making silly statements which
are shot down....

Get an Amiga if you want to see madden. There is an excellent
conversion available. Given that it runs on an A1200, it would be
*no problem* to port it to CD for the CD32. That`s one of the big
advantages of the CD32. It`s a new console, but since it`s basically
an Amiga, getting a large quantity of software out quickly is no
problemo. Of course, it won`t utilise the CD32 but at least it`s
good, playable software which will keep people happy til the
mega-games arrive....

rcmerrit@apgea.army.mil (Robert C. Merritt <rcmerrit>) writes..

>Why did the IBM (or Intel if you wish) PC become so dominate?

because they let people clone it which encouraged lots of people to
make cheap, powerful versions of it. It was also the first business
computer with any real power. As it dominated the business world, so
it is beginning to strangle the other markets by sheer weight of
numbers. It`s rather like a vermin problem....

>Anyways, my point is, I never really had a prefance towards the pc, however, it
>seemed all the factors FORCED me into a PC clone.
>(BTW, when I say PC, I mean those based on the Intel format)
>So is it simple the lack of availablity the reason the other formats aren't
>doing well?

Thats the problem, people are being forced into buying PCs as
software companies decide to maximise their profits and produce
solely for it. Thats good news for software companies, but bad news
for the consumer. In my opinion, the ONLY reason to buy a PC is to
use software which is unavailable for other formats. There are
plenty of alternatives which are faster and better, but don`t have
the software.

The other Formats are doing badly because of cronically bad
marketting and business strategy (C= and Atari). Apple has good
management and strategy, but is starting to suffer from the price
war. The PCs will smash apple price-wise

>And now both companies apear to be activly becoming videogame companies. So
>is it true that in 95 or so, that the pc will be the ONLY choice?
>Rob Merritt

Both C= and Atari seem to see their future in Videogames. Eventually
the PC will (unfortunately) be the ONLY choice for people who aren`t
prepared to `roll their own` software - ie it will be the computer
for consumers.

>100% on math. There's no reason for me to believe you when you claim that a 030
>acc. only gives you a 12% boost!

As usual Rick, you DIDN`t READ THE POST PROPERLY. I beleive RH was
saying that enabling the cache on his 030 only sped up his
applications by 12% over the cache-disabled versions.

How about doing the benchmarks on your 50Mhz 030 based A1200
Raist, and seeing how they compare with the F030. They should be at
least 3x faster, and would be more if memory access was important.
Kids! Dont forget that you can get a 6/80 030 50MHz A1200 for
around the same price as a F030 16Mhz 4/65 Falcon!!

Disclaimer: In the UK that is.

Yep, since the F030 lacks a digital input for sound, then it has
to sample EVERYTHING using it`s own 16bit ADC. I doubt it will
compare well with commercial samplers. Even worse, if you want to
sample a CD you must Xvert the 16 bit sample on CD to analogue, and
then back to digital, to read it into the F030.

I`m sure you can buy an add-on to give you digital inputs, but
aren`t falcon owners always boasting that the F030 has `all add-ons
as standard??`

Amen to that! The Macs main market is the *SAME* market as the PC
market. PC domination of this market is inevitable. I don`t like
PCs, but I have to acknowledge they will totally `assimilate` the
business market. (Actually, they already have but the Mac is still
hanging in there from it`s old established base.)

More and more, the PC is *the* choice for business use.

>Apple's doom is that they are unable to retreat because their operating system

cmedley@wam.umd.edu ('Flip') writes ...

>I think ANY system would benefit from the cache. A secondary cache would
>make life even more tolerable.

Very true. However, the point is that the Falcon seems to benefit
massively from the cache!
Conclusion: The 16 bit access is crippling the machine.

Why? Because Raists 50Mhz 030 based A1200, with FULL 32 bit access
*and* burst mode benefitted only a relatively small amount (but
still very useful and welcome) from the cache.
However, F030 programs show a much bigger improvement proving that
memory access is a very big factor on the Falcon.

My original (`A1200 15pc faster than Falcon?) post made the point
that the A1200 *may* be 15% faster with fastram than the F030
*BECAUSE* the F030 was crippled with its memory access, even though
on the face of it there is a faster clock speed (16 vs 14.2) and a
superior processor (030 vs 020).

This still hasnt been addressed. The only way would be to run a
large (preferrably commercial) program that is binary compatible to
both the machines and doesn`t depend on disk IO. I guess this is
probably impossible to prove.

>with no FastRAM.

Because most animation is done with delta compression which requires
CPU processing time. No blitter will help here as the CPU must
decompress the anim.

> "healthy" A1200s :) >

I would expect a Falcon to outperform a chipram only A1200 quite
easily. The fact that it doesn`t shows deficiencies in the Falcon
design. It may be faster, but not 2x as fast as a chipram only A1200.

Most Amiga owners will want to take the step of adding to the RAM
of the machine. @mb is OK to start with but you will soon want to
expand. Since a 4Mb RAM expansion will also double the speed of the
machine I think its a damn good option. You get the memory you need,
twice the speed and you lose the contention problems. I`d say an
A1200 is `crippled` as shipped, but at least the solution is easy,
cheap and practical. There is no cheap and easy way to get around
the 16 bit bus problems on the F030

I intend to buy a 4meg expansion soon, but not yet for a couple
of reasons

1) I`m unemployed and penniless and saving to buy Blitz Basic!

2) I want to see how the proposed CD32 expansion works out before I
commit money to a card that will block the trapdoor slot.

Because if I got an accelerator for an Atari, it'd be to speed up:

1) my MIDI sequencer
2) my favorite C compiler (currently gcc and g++)

Why would I dump all of my current software to get an Amiga to do the
same job when I would (as i plan to do, albeit later) buy an Amiga for
something it IS good at, namely video?

(speaking of which, I need to know if there are any programs for the Ami
that support the synchronization of the playback of an animation to an
external source, or failing that, could be planned out to have specific
events occur in the animation with about 1/50 second accuracy...)

I'm still lost.

If the Falcon is crippled and it outruns the Amiga 1200, what does that
make the Amiga 1200?

>CD32? It was the first place I went to get a demo of it. Eventualy I
>found one in Rumbelows, but they had no software to show me because they'd
>sold out of everything but their window machine.

In N.Ireland, Dixons in Belfast and Bangor both said that they WOULD
stock CD32 but were waiting for stocks. The Bangor salesperson was
very enthusiastic saying they had hundreds of requests and expected
to shift all their allocated stock long before Christmas.

CD32s were on sale early at Rumbelows but someone somewhere fucked
up and didn`t include any software in the boxes! Still, at least you
can play audio CDs and look at the boot-up screen!

I think prospective Jaguar owners could come to know this feeling!

>

Let me clarify this...

DIGITAL inputs would use optical cables, like what you see on DATs and
MiniDiscs to send the data from a source to a destination using a
method akin to (if not the same as) fiber optic cabling.

At this time, I know of no keyboard or sampler (professional or not) that
uses this method for output.

All of them currently use a set of 1/4" monaural jacks. The jacks recieve
and send ANALOG signals.

The Falcon comes standard with (yuck!) a 1/8" STEREO input. Because of
the nature of the Falcon's sound hardware, it can sample and playback
16-bit audio at once and if quality is a big deal and you don't like the
DACs in the Falcon or you want something more than an adapted 1/8" stereo
mini-jack for recording, then you can buy an adapter to improve on that.

However, if you look at the market, musicians who are buying digital
recorders tend to spend big bucks on their gear. At least right now, before
the prices drop. :)

If a musician's rig (or his/her own ear) demands it, they can improve the
quality of the DACs for a small fee.

But OUT OF THE BOX, the Falcon has 16-bit audio, 16-bit DACs, and a stereo
input (although i admit myself, i don't like the use of a stereo minijack,
if I'm going to pay $700 for Cubase Audio, I'll be getting the DSP connector
with it. :) )

> I`m sure you can buy an add-on to give you digital inputs, but

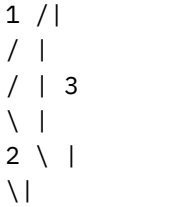
>Sure, HAM8, with as many as 64 colours to freely choose between ... do you
>know many graphicians actually using HAM8 when DRAWING pictures? (Not
>raytracing/digitizing)

Once more: People who want to do HAM8 graphics use 24-bit true-colour
paint packages such as TV-Paint, OpalPaint, Brilliance and so on. And FYI,
Brilliance for example uses the HAM8 capability to view the edited image,
but keeps the actual image off-screen in a 24-bit buffer, so you actually
draw in 24-bit colour, and Brilliance converts it to HAM8 on-the-fly. Very
nice for people without 24-bit graphic cards/framebuffers.

>RH> Rickard, Ham8 is a DARN USEFUL mode for real-time animation,
>RH> multimedia, raytraced art and paint. I am willing to bet that an
>RH> average 24-bit picture in 640x400 HAM8 will look SUPERIOR to a
>RH> 'True Color' Falcon picture.

>Sure, but can you do vektors in HAM8 for example?

Yep. Actually, it's brilliant for filled vectors. Can you figure out why?
OK, you couldn't, so I'll explain: Say that you want a filled triangle on
screen:



Now, normally you would do this by drawing a set of horizontal lines, namely
as many lines as the triangle is high. However in HAM8, you can take advantage
of the fact that a colour change in one pixel will remain in effect until it
is changed in another pixel. Thus you only draw line 1 and 2, so that it
modifies the colour registers to your desired colour, and then you draw line
3 so it changes it back to black, or whatever colour you want to change it to.
All pixels enclosed by the three lines will be of the same colour as line 1 and
2.

Satisfied?

>While the attention that the Atari Jaguar is getting from various magazines
>is encouraging, I am surprised that the 3DO is garnering more attention. In
>the September issue of Time, the Atari Jaguar is barely mentioned, compared
>with paragraphs and photos of 3DO and its makers. Both systems offer
>comparable power, yet it seems that the media has already counted Atari down
>and out (and Jaguar hasn't even been released yet!) while they focus
>attention on a much more expensive system. The magazine WORTH advises
>investors to look into the rage of the future... the 3DO! They make no
>mention of Atari whatsoever.

Remember: 3DO is not a single-manufacturer machine; 3DO is a "standard"
shared and supported by many big-name manufacturers. This is the same
reason why VHS "won" the war with Betamax, even though Beta is technically
better; VHS was licensed to many manufacturers and Beta was proprietary to
Sony.

No matter whether the articles highlited this fact (I do not know, since I
haven't read any), the writers and publishers are clearly aware that 3DO is
a big deal because it is supported by big companies.

Atari will probably only get such attention if the product sells well--that
is, after the fact--whereas 3DO is getting attention before any products
are released because of the reasons outlined above.

## 2098. 3DO vs. Jaguar... Does anyone remember the MSX?

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-24 02:37:42 UTC
From: cmedley@wam.umd.edu
Message-ID: <27tmhm$m7q@cville-srv.wam.umd.edu>
Source record: 21228

One thing I'm worried about with 3DO is that it seems similar to the attempts to make MSX computers the "de facto" standard back before the IBM PC took over.

I don't think anyone in America remembers these, but there were massive write-ups about these, and they looked nice on paper, and the same companies backed MSX that are going for 3DO.

Personally, I think 3DO has a better chance because people *want* something like this... the demand is there... but the price is too high right now, i think.

:
: If there are better alternatives to gcc in terms of good code
: generation then someone must of done an awfully poor port of gcc for the
: Amiga. Gcc is fairly well known in the unix world for the quality of
: it's optimizer, to the point that people with Sun's run gcc and throw
: away Sun's compiler.

[ sigh ]

GCC might have the best optimizations, but it doesn't make very nice
AMIGA programs. A lot of GNU C programmers use it for their own work
and don't release the binaries. DICE has loads more support and
compiles better Amiga programs. If I wanted lots of unix-a-like
command line driven programs, then GNU C would be good.

Programmers tend to get the best available compiler. Code generation
is once facet of programming. Easy of use, system requirements,
development tools and support are other factors. Dillon' Intergrated
C Environment is a good shareware program that meets the other
requirements.

I've got heaps of shareware/freeware stuff on my 340mb hard-drive that
were programmed with DICE. I've got a few, very big programs, like
Latex, unix-ports of adventure games that are huge that were made with
GNU, probably because it was a very simple unix-amiga port, made
simpler by using GNU C.

- Jim

PS. I'm not a programmer.

Actually, I think that there will always be an alternative. There are always going to be people not happy with the "standard", such as ST and Amiga owners. For that reason, there will always be competition in the computer market. I still believe that if Atari can sell the Jaguar then the Falcon still has a chance to take off yet.

# 2111. Re: What are the hardware/software specs of the Falcon?

Newsgroup: comp.sys.atari.advocacy

From: Iain.Laskey@barclays.co.uk
Message-ID: <CDv2nx.vB@barclays.co.uk>
Source record: 21155

1,4 or 14Mb RAM, optional built in IDE 2.5 inch HD (usually shipped as 4/65 or 4/80 at the moment). Many graphics modes built in and more available using cheap hardware addons upto 1400x800x16. usually 800x600x16 is a usable figure. 2,4,16,256,'truecolour' colour modes. 16Mhz 68030. Slot for co-pro. Slot for 2nd processor. SCSI2. 1.44 Floppy. 56001 DSP chip. 3(?) sound systems. Built in sampling upto 50-odd khz (DAT rates) 16bit. Can sample direct to HD. MIDI ports. 2 normal joystick ports plus 2 extended ports which accept various things like light pen etc. Plus lots more!

There is already some very nice 3rd party software & hardware and lots of good PD/shareware stuff. You can attach genlocks, video digitisers, pc emulators (1024x768x256 while running Windows 3 - I'm told), graphics enhancers etc. Needs a multisync to get the best out of the graphics but a normal SVGA screen will do.

# 2112. Dhrystone-Benchmark

Newsgroup: comp.sys.atari.advocacy
Date: 1993-09-24 14:23:52 UTC
From: zcam1121@rpool9.rus.uni-stuttgart.de
Message-ID: <27uvto$odt@info2.rus.uni-stuttgart.de>
Source record: 21146

Hi there!

This is my second try. This time it is the well known Dhrystone benchmark
which i have tested. I only have the figures for the Falcon, so, if any
A1200 user has GNU-C: please make these tests and post your figures!
(I am not hoping to get the figures of a A1200 with FastRAM... i'm still
waiting for the results from my last benchmark :).

How to make the test:
You must have: GNU C (Versions 2.x).
You can get the bechmark via ftp from: src.doc.ic.ac.uk
Directory: /packages/unix-c/benchmarks File: dhrystone.c
If you have another dhrystone-benchmark please make sure that it is the
same version!
Then you will have to set some defines:
#define LOOPS 100000 /* 50000 Loops are too inaccurate */
#define TIME /* if your GNU C port has the time() function */
#define HZ 60 /* all tests were done with 60 Hz */

The dhrystone benchmark consists of:
assignments 53%
control statements 32%
procedure, function calls 15%
It is a general purpose benchmark. I hope you can trust the figures...

F30-BENCHMARKS:

OS | Resolution | Caches | Dhrystones | Time | Improvement...
--------+------------------+--------+------------+------+---------------
TOS 4.01| 640x200x4 60 Hz | ON | 2631 | 38 s | 116 %
" | " | OFF | 2272 | 44 s | 100 %
--------+------------------+--------+------------+------+---------------
TOS 4.01| 640x240x256 60 Hz | ON | 1851 | 54 s | 122 %
" | " | OFF | 1515 | 66 s | 100 %
--------+------------------+--------+------------+------+---------------
TOS 4.01| 640x200x2 60 Hz | ON | 2777 | 36 s | best possible
--------+------------------+--------+------------+------+---------------
MultiTOS| 640x200x4 60 Hz | ON | 1724 | 58 s | 124 %
" | " | OFF | 1388 | 72 s | 100 %
dito with highest priority| ON | 2500 | 40 s |
--------+------------------+--------+------------+------+---------------
MultiTOS| 640x240x256 60 Hz | ON | 1041 | 96 s | 129 %
" | " | OFF | 806 |124 s | 100 %
dito with highest priority| ON | 1724 | 58 s |
--------+------------------+--------+------------+------+---------------
MultiTOS| 640x200x2 60 Hz | ON | 2631 | 38 s |

```
--------+------------------+--------+------------+------+---------------
```

Notes:
What does "highest priority" mean:

| Name | Priority |
|---|---|
| MINT | 0 |
| AESSYS | -20 |
| SCREEN | -20 |
| NEWDESK | -20 |
| PS_CONTR | -20 |
| XCONTROL | -20 |
| MINIWIN | -20 |
| DHRYSTON | 20 |

There are 8 processes running. MiNT must have priority "0". All other
(except DHRYSTON) have the priority "-20".
Under MultiTOS the benchmark is running in a window, under TOS it is
not (that means additional time for window-handling).

The figures in 640x200x2 (monochrome) mode are the best you can get
on a (base-) Falcon (well...with the small program ROMSPEED you can get
3125 Dhrystones in this mode - this program copies the ROM in the RAM
which is approximatly 7% faster).

THE "REAL-LIFE-DISCUSSION":
You see, in this benchmark, the improvement caused by the cache is only
16 - 29 % !

I have made some other tests with "real life"-programs. Here are the
results:

Compiling 10644 lines GFA-Code: Improvement:
with caches: 28.215 s 214 % !!!
without caches: 60.51 s 100 %
(GFA-Basic 3.5E, no harddisk I/O)

TEX, compiling 19 pages:
with caches: 116.0 s 115 % + I/O
without caches: 133.7 s 100 %
(MultiTEX 5.1, very much harddisk I/O)

St-Zip packing a 350 Kb file:
with caches: 20.3 s 177 % + I/O !
without caches: 36.0 s 100 %
(ST-Zip 2.2, few harddisk I/O)

GemView loading/depacking/dithering a JPEG picture:
witch caches: 56.8 s 156 % + I/O
without caches: 88.9 s 100 %
(GemView 2.46, 768x462 JPEG, few harddisk I/O)

TopazFractal calculating/drawing a 616x415 fractal:
with caches: 16.5 s 181 % !
without caches: 29.8 s 100 %
(TopazFractal 1.41, Integer mode, no harddisk I/O)

LHarc packing a 360 KByte file:
with caches: 38.1 s 126 % + I/O
without caches: 48.1 s 100 %
(LHarc 2.22, no harddisk I/O)

Calamus SL (DTP) loading/calculating/drawing test page:
with caches: 22.4 s 163 %
without caches: 36.4 s 100 %
(Calamus SL, test page: euroscale, no harddisk I/O)

PFXPack packing a 330 Kb file:
with caches: 188.5 s 128 %
without caches: 242.0 s 100 %
(PFXPack, no harddisk I/O)

TeXDraw converting a IMG picture to TeX source:
with caches: 20.2 s 149 % + I/O
without caches: 30.1 s 100 %
(TexDraw 2.01.2, few harddisk I/O)

**********RESULTS:**********
Improvement by caches in "real life": 15 - 114 % !
If we take only the programs without harddisk I/O we have: 28-114 %
Arithmetic middle: 57 %
(without the programs with harddisk I/O: 72 % !).

You see: this benchmark is bad for systems with caches, but i did it
anyway.

Ciao, Heiko.

Well, I don't think the PC is an elegant design, but I am getting a 486
system nevertheless to complement my current computer setup. Primarily
because Psygnosis' SEGA development system is MS-DOS based, but I also
want to play around with it and have a closer look at what the US game
companies and our PC programmers are up to.

>

Now we get to the heart of the whole ideological war. :)

How in the world can a machine with a less powerful processor and fewer
built-in I/O ports, and no DSP (and no WAY to add one, either!) have more
potential? Potential for what, is the key thing to consider...

And on the issue of speed and crippling, perhaps the whole point is that
if Atari can be said to have crippled the Falcon by putting a 16-bit
bus from the 68030 to RAM, the Amiga 1200 was crippled by Commodore's
decision to go with a 68020.... and it was crippled so much that when you
take it out of the box and put it next to a Falcon out of the box, it
is slower.

Personally, I like the Amiga 1200, and may wind up using one myself for
video work (still checking to see if it has the one killer app i need to
make the purchase worth it) but I don't see how it is so much better than
a Falcon as Amiga owners claim.

(especially not when it is slower and offers fewer options standard...)

The only thing it has going for it is the low price, and if that were all
that counted, the Amiga 4000/40 wouldn't have a chance against the current
(and cheap!) '040 Macs and Centris machines.

The only problem here in the States is that ONLY Amiga owners know about the CD^32, therefore ONLY Amiga owners will buy it. Someone sent me E-Mail regarding the CBM "Head Honcho"'s philosophy on advertising:

"A good product will sell itself, with or without advertising" (paraphrased)

That's fine if you have a good reputation in the field. Commodore's best move would be to rename their company, rename the Amiga to something else, and start anew (perhaps licence out the hardware to cloners and do away with inhouse production).

I live in a fairly small town. When the Amiga was first introduced on the market, there was a good demand for them (hell, the Sears in town here used to sell them, I stress USED to sell them). Now there is one place in town that sells the hardware (run by a bunch of boneheads who have absolutely no clue as to what is going on), and Software Etc. is trying to get rid of the software stock (again they have no clue. Thought the CD^32 was a 3DO product.)

I fear the CD^32 will not do well here without public recognition. In Australia, "Amiga" is synonymous w/great games. Over here, the name is ridiculed. I'm afraid the notion that it will be sold everywhere Segas are won't work here. How can you expect stores to take a risk on carrying a product when they have no idea what it is/does. Again, this would be eliviated by some advertising.

You may have guessed by now that I strongly disagree with the philosophy of the powers that be at CBM. In todays market, unless it is a total breakthrough (yes, the CD^32 is a great machine, but by no means a breakthrough technologically) you have absolutly NO hope of selling it without sufficient public recognition. This means more than infomercials (CD-I supposedly has them, it isn't doing them one damn bit of good, but they have the Philips name, so they get some press coverage.), and cable broadcast commercials. I realize that this all costs money (which Commodore may or may not have), but you have to spend money if you have any hope of making money.

> [More Deleted]

I agree with your sentiments on this issue. I think that the Jaguar
has a very good chance because of its price structure.

It is very amusing that Time says somenthing to the effect that
"Nintendo plans to leapfrog this step and go for a 64 bit machine". The
Jaguar IS a 64 bit machine. They did not mention that. That is almost
criminal! :-) If that was the only additional thing they mentioned, it
would have been a fair article. You can't expect them to give Atari a
lot of attention after the first paragraph says somenthing about the
"Rise and fall" or Atari. (I.e. time has declared them officially dead!
Ahahah....) Anyhow, if they had said "Atari is coming out with a 64 bit
machine that will be out in January" it would have been a much better
article. Instead they are going to try to ignore it, which may be what
the public does if it is not well advertised starting very soon.

I agree with you Stefan about the PC... it is an interesting platform because
so many people have had time to add neat expansions to it and help it progress
in to quite a usable platform.

Incidentally, I noticed your post mentioned Psygnosis... there was an article
in a magazine over here claiming they had a "new method" for programming
TurboGrafx/Duo games to get 4096 colors on screen at once using a method
called "Hold and Modify".

(is that familiar sounding to all the Amiga owners?)

The programs using this technique are supposed to pop up in a year or so...
I'm just curious as to whether this is fact or fiction or cannot be talked
about because you'll be killed for disclosing trade secrets. :)

It's called research.... a lot of magazines will just do reports
on what's handed to them. Atari has not really been promoting the Jag
like 3d0 has... 3d0 has barraged the media with ads, facts, etc... demos..
The reporters etc... usually ignorant of technology etc. will just to a
superficial report on what info is easily available. How many articles on
Multimedia have you seen that don't mention the Amiga when they claim to
cover all systems? How many articles on Music with Computer have you seen
that don't mention the Atari when they claim to do a look at the whole
market....

My god, you're stupid. There is no difference in the quality of an EC
part and a RC part. The abbreviation EC stands for `Embedded Controller',
and EC processors are often used as such in electronic appliances (even
in cars). The only real difference between the RC and EC part is that the
EC part is differently packaged, and only brings out 24 address lines,
instead of 32.

Oh, great! So you mean you can actually have one orange playfield, and one
cyan playfield, and where there is data in both playfields, the outcome is
the composite of these two? Sounds very useful in real-life situations.

>Maybe "playfields" wasn't the right word, but then, have you seen some of the

zcam1121@rpool9.rus.uni-stuttgart.de (Heiko Hartmann) writes:

Just out of interest, I ran the same benchmark on my A4000/040 and
A3000/030:

A3000: 25MHz 68030, 8M Fast, 2M Chip
A4000: 25MHz 68040, 16M Fast, 2M Chip

Especially the A3000 is interesting, because it runs the same processor
as the Falcon, but in a well-designed system (32-bit paths, burst
available). It does run at a higher clockspeed, but by multiplying the
execution times by 16/25 you roughly get how a 16MHz part would
perform.

The resolution the machines ran in are irrelevant here, since there is
no contention, but anyway, the A4000 ran 976*612 in 64 colours, and the
A3000 ran a 760*560 display in 8 colours. I increased the loopcount
from 50000 to 500000 because using 50000 would be ridicilous on these
machines (low accuracy). I compiled using GCC 2.4.5. The A4000 test
was not run in a "clean" system. I had this terminal program and a
number of other tasks running in the background, so the figure below
is probably a bit low.

>F30-BENCHMARKS:

> OS | Resolution | Caches | Dhrystones | Time | Improvement...
>--------+------------------+--------+------------+------+---------------
>TOS 4.01| 640x200x2 60 Hz | ON | 2777 | 36 s | best possible
>--------+------------------+--------+------------+------+---------------
>MultiTOS| 640x200x2 60 Hz | ON | 2631 | 38 s |
>--------+------------------+--------+------------+------+---------------

A3000/030/25MHz:

OS Caches Dhrystones/s Time Comment
-------------+--------+------------+------+----------
AmigaDOS 3.1 | ON | 8064 | 62 s | Cache+Burst
AmigaDOS 3.1 | ON | 7352 | 68 s | Cache+NoBurst
AmigaDOS 3.1 | OFF | 5434 | 92 s | NoCache+NoBurst

A4000/040/25MHz:

OS Caches Dhrystones/s Time Comment
-------------+--------+------------+------+----------
AmigaDOS 3.1 | ON | 27777 | 18 s | Cache+Copyback

Summary:
========

The "A3016" entries are the equivalent 25MHz results scaled to 16MHz. This is a pretty accurate indication of how fast a real 16MHz system would be. A real 16MHz system would probably even be faster than this, because of the general slowness of RAM.

```
--------+---------+------+---------------------
OS | Dhry/s |Ratio | Comment
--------+---------------+---------------------
MTOS | 2631 | 1.00 | Falcon/030 running MultiTOS, best possible
TOS4.01 | 2777 | 1.05 | Falcon/030 running TOS 4.01, best possible
A3016 NC| 3477 | 1.32 | A3000/16 Caches off, no burst
A3016 | 5161 | 1.96 | A3000/16 Caches on
A3000 NC| 5434 | 2.07 | A3000/25 Caches off, no burst
A3000 NB| 7352 | 2.80 | A3000/25 Caches on, no burst
A3000 | 8064 | 3.06 | A3000/25 Caches on
A4000 | 27777 |10.56 | A4000/040/25 Caches on
```

What conclusions can we draw from this? Well, first of all, we see that the A4000/040 pretty much crushes the Falcon ;-).

Otherwise, we can see that an equivalent system with a well-designed full 32-bit bus able to take advantage of burst-mode would be almost TWICE as fast as the Falcon/030 is. Even with all caches turned off, it would be 32% faster than the Falcon/030 is now.

This pretty much proves that the 16-bit bus severely cripples the Falcon.

Any questions? Feel free to ask.

>Ciao, Heiko.

Not only that, he didn't (or chose not to) use the DSP
for the obvious reason that the Amiga 4000/040 would be put to shame,
and the 4000/030 would look paperweightish. :)

By all means, use the DSP! It would be interesting to see the results.
I'm not really sure how you're going to use it in a dhrystone benchmark,
though. But remember to use a C compiler to generate the code; no
assembly downcoding.

Actually, I'm leery of saying it is a better compiler based on Dhrystone or any standardized benchmark of that nature because many compilers will be optimized to beat specific benchmarks. Admittedly, it looks good, but then, we haven't tried any other ST C Compilers.

As for the benchmark results, it is interesting, but why didn't you test an Amiga 1200? If you want to test A3000s, then we should whip out an Atari TT030 (really fast 030 machine....a 33mhz one :) ) and see how those two systems compare (after all, both have been orphaned or dumped by their creators, right?).

:)

So in conclusion:

1) both the Falcon and A1200 are crippled
2) if you want real speed, go buy a TT or an A3000 which are now no longer being made, but have faster CPUs.

That's actually true... for the Dhrystone and many other benchmarks the
DSP in the Falcon would burn the A4000/40. Of course, the 56001 is not a
general purpose processor, but it would make a good account of itself in
bencmarks it is suited for. :)

Of course, the original purpose of this thread was to compare Falcons and
A1200s.. the low-end machines of the new generation.. the lowest common
denominator of both company's lines of machines. Stefan has now thrown
down the gauntlet on TT owners by bringing back the now discontinued A3000. :)

I have no idea about many of those machines, but before the Atari ST came
out, Yamaha (who makes musical instruments) put out the Yamaha CX5M (i think
that was the name) which was an MSX-based computer with MIDI. If could run
MSX software, etc.. and use the peripherals. Later on, when the ST line
came out, I think that wiped those machines out totally...

Lynx, Jaguar, Big Black Cat... Anyone beginning to see a pattern
here???

I think _you've_ missed the point, Flip. The article, at leastt to
me, clearly stated what the author wanted to show by comparison. The
benchmark tests did show that the Falcon is 'crippled', when compared to
a 68030 run on a full 32 bit bus capable of burst filling the cache. If
you'd ever read any of Dave Small's notes regarding the design of his
'030 ST accelerator, this would have been obvious without the A3000
tests. I think the article definately shows that if Atari had have
designed the Falcon as a 32 bit machine, it would have been a far faster
machine.
In fact, if any enterprising TT owner is reading this, and would
like to help add to this info, I have thought of a rather interesting
test. If the TT could be set to run at 16mhz, possible through finding
the 16mhz clock driving the rest of the TT and connecting it to the
'030's clock input, then the same gnu C benchmark could be run on a
machine that was 32 bit and 16mhz. Run the test in ST ram on the TT and
